EXECUTIVE SUMMARY

The Special Reclamation Fund Advisory Council (the “SRFAC”) was established by the Legislature in 2001 to ensure the effective, efficient, and financially stable operation of the Special Reclamation Fund (the Fund). (W.Va. Code § 22-1-17). According to W.Va. Code § 22-1-17 the SRFAC shall consist of eight members, including the Secretary of the West Virginia Department of Environmental Protection (WVDEP) or his or her designee, the Treasurer of the State of West Virginia or his or her designee, the Director of the National Mine Land Reclamation Center at West Virginia University and five members to be appointed by the governor with the advice and consent of the Senate.

The Fund is designated by the Legislature for the reclamation and rehabilitation of lands subject to permitted coal mining operations and abandoned after 1977, where the bond posted is insufficient to cover the cost of reclamation. The Fund is presently funded by a tax of 27.9 cents per ton of clean coal mined in West Virginia. From this revenue, funds based on a tax rate of 15 cents per ton are being paid into the Special Reclamation Water Trust Fund (SRWTF), while funds based on a tax rate of 12.9 cents per ton are being paid into the Fund. According to W.Va. Code § 22-3-11, “Beginning with the tax period commencing on July 1, 2009, and every two years thereafter, the special reclamation tax shall be reviewed by the Legislature to determine whether the tax should be continued: *Provided*, That the tax may not be reduced until the Fund and SRWTF have sufficient moneys to meet the reclamation responsibilities of the state established in this section.”

The SRWTF was created “for the purpose of assuring a reliable source of capital to construct, operate, and maintain water treatment systems on forfeited (revoked) sites.” (W.Va. Code § 22-3-11).

The Secretary of the WVDEP is required to conduct formal actuarial studies every two years and conduct informal reviews annually on the Fund and SRWTF. The SRFAC is also required to make a report to the Legislature every year on the financial condition of the Fund. (W.Va. Code § 22-1-17). The report is to include: “A recommendation as to whether or not any adjustments to the special reclamation tax should be made considering the cost, timeliness, and adequacy of bond-forfeiture reclamation, including water treatment and a discussion of the SRFAC 's required study issues.”

In accordance with the statutory requirements, the SRFAC submits the following:

Recommendation:

Based upon conclusions drawn from information included in this report, the SRFAC makes the following recommendations to the Legislature:

The SRFAC recommends that the present 12.9 cent per ton tax dedicated to the Fund remains in force and that the tax dedicated to the SRWTF remains at 15 cents per ton. It was previously established by the Council that the Fund would cover all costs for both land reclamation and water treatment through June 2018. Then starting in July 2018, the SRWTF would begin covering the cost for water treatment—both water capital costs and ongoing water treatment costs. Following reviews of the financial status and investment earnings of both funds it was the consensus of the Council to continue paying for all reclamation costs out of the Fund to allow SRWTF to continue building assets while earning higher yields. It was also agreed that fund transfers from the SRWTF to the Fund would occur, as needed, to maintain a Fund balance of \$10,000,000.

The SRFAC further recommends that the State Legislature form a panel to examine the elements of our state code that result in uncontrolled liabilities, and to propose a State legislative initiative to rationalize water quality regulation to meet the conditions of the Federal Clean Water Act (CWA) while adding rationality and certainty to the process.

The SRFAC recommends that the Legislature continue to examine the implications of the recent court rulings and subsequent lawsuit settlements on the Special Reclamation Fund, Abandoned Mine Lands, and voluntary efforts by citizen-led watershed groups to address historic mining reclamation related liabilities. The SRFAC further recommends that the Legislature examine the mine reclamation and bonding programs of other states as implemented in Tennessee, by the federal Office of Surface Mining to determine whether the statute and regulations creating the Fund and SRWTF in West Virginia have inappropriately interpreted SMCRA to require long-term CWA liabilities. The SRFAC further recommends the Legislature examine the separate and distinct authorities of the CWA in assessing the eligibility of future forfeitures for transfer of liabilities to SRWTF. The SRFAC is concerned about the default transfer of water treatment liability to the SRWTF when opportunities exist to pursue responsible parties under the CWA per the requirements of an NPDES (CWA Section 402) permit.

Study Topics

- Review of the current investment strategy
- Continue review of DMR database and improvement to functionality. A priority addition is to include a data field that indicates whether an active permit is treating AMD, or other water pollutants, as part of the effort to compile water management and treatment costs on active sites.
- Continue to improve upon the active mine pollutant inventory.
- Consensus Coal Forecast and Actuarial Modeling Improvements for 2025 Study

Notable Projects:

- Southwestern Energy (SWN) partnership for Operation & Maintenance ongoing for two sites.
- Rare Earth Elements Extraction Plant combined with new Acid Mine Drainage Treatment facility continues to be fine-tuned at site A34, near Bismarck WV.
- In 2024, a study was completed that compares the expected costs and benefits of the watershed strategy for treating AMD vs point source treatment within Muddy Creek (Ziemkiewicz, Risch). Results indicate that the 10-year capX + opX costs could be around \$ 2.6 million less using the watershed strategy and that stream recovery totaled 19.2 miles. On the other hand, previous experience using a point source (NPDES) treatment strategy resulted in much higher cost while recovering zero stream miles (table 1), even though capital costs are lowered with this strategy. In addition, costs to the SRWTF were significantly reduced by a voluntary contribution by Southwestern Energy Co. When combining this contribution with the savings from the watershed approach the 10-year costs are expected to be \$9.1 million lower.

2024 SRF Advisory Council Annual Report

Table 1. Summary of costs and benefits related to point source vs. watershed level treatment strategies. The example reflects the actual costs for implementing the Muddy Ck. Project and includes the voluntary contributions by Southwestern Energy Co.

Cost (\$2023)	STRATEGY		
	Point Source	Watershed*	Watershed**
CapX	\$19,700,000	\$25,400,000	\$25,400,00
SW Contribution [1]		(\$3,100,000)	
Net CapX	\$19,700,000	\$22,300,000	\$25,400,000
OpX per yr	\$1,410,000	\$580,000	\$580,000
SW Cont/yr		(\$340,000)	
Net OpX (10 yrs)	\$14,100,000	\$2,400,000	\$5,800,000
Total Over 10 Yrs	\$33,800,000	\$24,700,000	\$31,200,000
Savings		\$9,100,000	\$2,600,000

* with Southwestern Energy Contribution (SW)

** without Southwestern Energy Contribution (SW)

[1] Southwest paid \$2.5 million in 2017 and 2018. This value is inflated to \$3.1 million in \$2023 using the Producer Price Index (PPI) Commodity for All Final Demand from the Bureau of Labor Statistics (BLS).

Membership of the Special Reclamation Fund Advisory Council

Matthew Butler, Deputy Director for the Division of Land Restoration, is serving as the member representing the Cabinet Secretary of the WVDEP. Lindsay Marchio serves as the member representing the Treasurer of the State of West Virginia. Dr. Paul Ziemkiewicz serves as the member representing the Director of the National Mine Land Reclamation Center at West Virginia University. Christine Risch, Marshall University, Center for Business and Economic Research, serves as the Actuary/Economist member. Jason Bostic serves as the member representing the interests of the coal industry. James Kotcon serves as the member representing the

interest of environmental protection organizations. Ronald Pauley serves as the member representing the interests of coal miners. Christopher Pence serves as the member representing the interests of the general public.

BACKGROUND ON THE SPECIAL RECLAMATION FUND

In 2001 the legislation establishing the SRFAC also increased the tax on clean coal mined in West Virginia, from three to seven cents per ton (the “Continuing Tax”) and levied an additional seven cents per ton (the “Temporary Tax”), to be deposited into the Fund. The revenues of the Fund were designated to pay for reclamation on post-1977 bond-forfeited (revoked) sites.

The 2001 legislation provided for the Temporary Tax to be in effect for thirty-nine months. As a result of a 2005 actuarial report finding that the expiration of the Temporary Tax would result in nearly immediate insolvency of the Fund, the Temporary Tax was extended by the Legislature in 2005, for an additional eighteen months. A 2007 actuarial study commissioned by the SRFAC found that the failure to extend the Temporary Tax again would result in insolvency of the Fund. Accordingly, in 2008 the Legislature, through SB 751, created the SRWTF and enacted a temporary, twelve-month tax of 7.4 cents which was to be allocated between the Fund and a SRWTF. Twelve and nine-tenths cents were dedicated to the Fund and 1.5 cents was deposited into the SRWTF. An updated actuarial study in 2008 concluded that terminating the temporary tax would result in insolvency within a few years. In response, during the 2009 legislative session, the Legislature amended W.Va. Code § 22-3-11 to remove the expiration date for the Temporary Tax and provided instead for biennial review of the Tax by the Legislature. (Acts of the Legislature 2009, chapter 216).

Based upon projections under the 2011 Actuarial Analysis performed by Pinnacle Actuarial Resources, Inc. the Fund was found to be sufficiently funded under the existing 12.9 cent tax. However, the SRFAC was concerned that as the SRWTF began making payments for water capital and ongoing water treatment in Fiscal Year 2019, as projected, the SRWTF would fall into a deficit position in the second year of operation-2020. (2011 Actuarial Valuation, page 3). Declining coal production projected by the 2011 Consensus Coal Production Forecast and the significant increase in water treatment costs resulting from court rulings in two cases were contributing factors in the projected insolvency of the SRWTF. Accordingly, in 2012 the Legislature increased the special reclamation tax to 27.9 cents per ton, 15 cents of which was to be deposited into the SRWTF.

Based upon projections under the 2013 Actuarial Analysis performed by Pinnacle Actuarial Resources, Inc. the Fund was projected to be over 100 percent funded using a 20-year cash flow basis and 95.7 percent funded

2024 SRF Advisory Council Annual Report

using a 35-year cash flow basis. The SRWTF was (and is today) accumulating 15 cents per ton coal tax revenue and interest and was projected by the 2013 Actuarial Valuation to be 150.4 percent funded using a 20-year cash flow basis and 89.9 percent funded using a 35-year cash flow basis.

Based on the 2015 Actuarial Analysis conducted by Taylor & Mulder, the Fund was projected to fall to a low of \$51.5 million in 2018. This was due to paying all reclamation costs for both land and water as well as operation and maintenance costs associated with water treatment. The Fund was projected to then recover to \$187.5 million slowly by the end of the twenty-year study period, at which point an \$8.2 million liability would remain. SRWTF was expected to accumulate approximately \$120 million by 2018 before beginning to support water reclamation costs in 2019 (*However, it should be noted that as of December 31, 2017, the balance in the SRWTF had only reached \$104 million*). Afterwards, SRWTF was projected to show gains, reaching \$289.8 million by the end of the twenty-year study period with a \$110.5 million liability remaining. Both funds combined were projected to total approximately \$477.3 million at the end of the twenty-year study period with a total remaining liability of \$118.7 million.

Based on the 2017 Actuarial Analysis conducted by Pinnacle Actuarial Resources, Inc, the results indicated that on a present value basis the Fund is 97.3% funded over a twenty-year projection and 93.6% funded over a thirty five-year projection period but indicated that the fund would go into a negative balance in 2021. The SRWTF is 162.6% funded over a twenty-year projection, 151.4% funded over a thirty five-year projection period and is fully funded throughout the entire projection period. Combined the two funds are 123.4% and 115.8% funded over twenty and thirty five-year projections respectively, and fully funded throughout the entire projection period. Pinnacle determined that a transfer of \$38 million in assets from the SRWTF to the Fund would keep the Fund in a positive balance position throughout the projection period without causing the SRWTF to move into a negative balance.

In 2019, the timing of the actuarial analysis changed to a twenty-year analysis as well as being performed every two years.

Taylor and Mulder 2019 projections of revenues and expenses to the Funds imply that the Funds will be solvent on a cash basis through 2039.

The chart below (Figure 1) shows a simplified cash flow projection for the SRF and WTF combined over the next 20 years. Note that these projections assume that money will be transferred from the Water Trust Fund to the Special Reclamation Fund to maintain a minimum fund balance of \$10,000,000.

Figure 2

Taylor and Mulder 2023 projections of revenues and expenses to the Funds imply that the Funds will be solvent on a cash basis through 2043. Note that these projections assume that money will be transferred from the Water Trust Fund to the Special Reclamation Fund to maintain a minimum fund balance of \$10,000,000.

The chart below (Figure 3) shows a simplified cash flow projection for the SRF and WTF combined over the next 20 years.

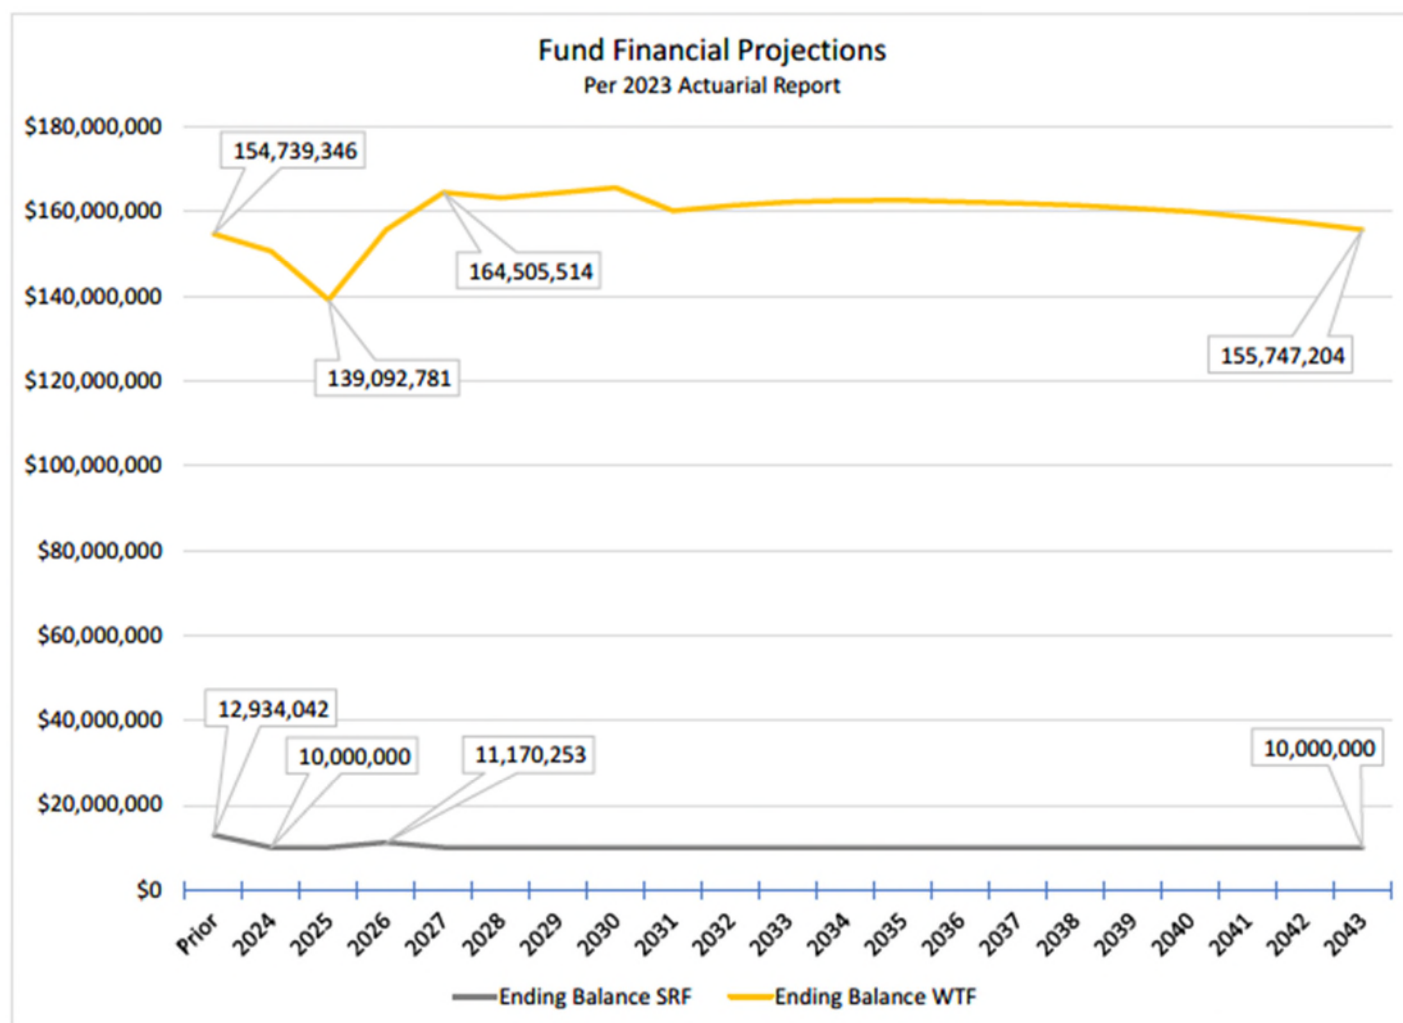

Figure 3

ACTUARIAL REPORT RECOMMENDATIONS (2023)

Coal Production Risks: There has been some instability in coal production forecasts and the coal market in general over the preceding decade because of different regulatory regimes, alternative energy adoption rates, economic events, and, most recently, the COVID-19 pandemic. Future studies may benefit from considering alternative coal production scenarios.

Permit Status History: Permit databases were evaluated as of a specific date. However, because this study estimates anticipated changes in permit status over time, it is necessary to make assumptions about permit statuses

change to develop revocation models. If records exist, it could be possible to produce more accurate models if a full history of each permit (including all status changes over time and dates when status changes occurred) were available.

COAL CONSENSUS FORECAST by Marshall University-Center for Business & Economic Research

Consensus Forecast: The four long-term forecasts produced by EIA, EVA, CBER and BBER are combined to create the 2023 Consensus Forecast for West Virginia Coal Production. For simplicity, a simple average was used to calculate the consensus forecast⁴ (Figure 6). Coal production in West Virginia is projected to decline steadily from 83.5 million tons in 2022 to 59.6 million tons in 2045.

Figure 6: Consensus and Component Forecasts 2023 (million tons)

Source: EIA, EVA, CBER, WVU, and Marshall University Department of Mathematics.

Summary: The four component models incorporate a range of possible levels of West Virginia coal production over the next 22 years, with varying forecasts that illustrate the impact of primary supply and demand

variables and uncertainty over the continuation of recent trends. The consensus reduces uncertainty by combining the forecasts into one aggregate projection. The consensus forecast predicts West Virginia will experience a gradual decline in coal production throughout the period, but at levels that are four to seven million tons per year higher than the 2021 Consensus Forecast.

FINANCES OF THE SPECIAL RECLAMATION FUND & THE SRWTF

This section of the Report to the Legislature outlines the financial status of the Fund and the SRWTF for calendar year 2024 and provides comments regarding the future financial position of both. The three key factors that have the most effect on the adequacy of the Funds is the coal production levels in West Virginia, the risk of future forfeitures, and the cost of reclaiming existing and future bond-forfeited (revoked) sites.

WVDEP acknowledges that future forfeitures and any water management costs associated with them could affect funding needs of the Fund and the SRWTF. WVDEP is currently working to compile water management and treatment costs on active (still permitted) sites to better inform the actuaries and policy makers in prediction of future water management and treatment costs associated with revoked sites. Additionally, the SRFAC is continuously looking for ways to improve upon the ability to project future forfeitures, which will continue to be a focal point of the SRFAC. The Office of Surface Mining Reclamation and Enforcement (OSMRE) supports WVDEP's efforts to improve the active mine pollutant inventory to ensure the accuracy of future forfeiture cost projections and has formed a team with WVDEP to develop a work plan for obtaining additional data.

To summarize the data and analysis that follow, it should be noted that the Fund will continue to pay for all costs for both land reclamation and water treatment. Money transfers from the SRWTF to the Fund will occur as needed to maintain the Fund balance of \$10,000,000. Increased revenues for the SRWTF are attributed to the tax increase in 2012 as well as the improved investment strategy which was initiated in 2013 as described below.

In May of 2013, following numerous discussions between WVDEP personnel and members of the Investment Management Board and the Board of Treasury Investments, the SRFAC was updated on various investment options and made the following recommendations:

The first recommendation was in two parts:

1. That the current balance of the Water Quality (WQ) Trust Fund and all additional revenue of the WQ Trust Fund through Fiscal Year 2018 be invested in the Investment Management Board (IMB) Fixed Income Pool until FY 2019.

2024 SRF Advisory Council Annual Report

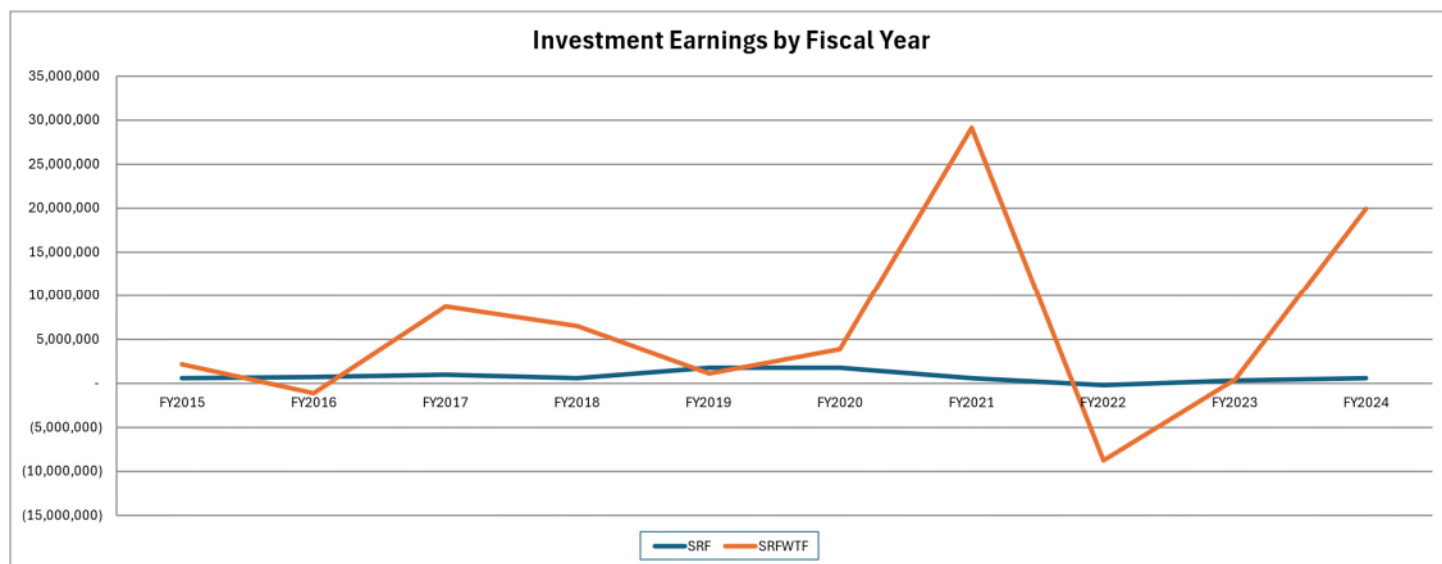

2. That the WVDEP develops plans to maximize the return on investment for future WQ Trust revenue.

The second recommendation was also in two parts:

1. That the current balance of the Special Reclamation Fund be invested in the Board of Treasury Investments West Virginia Short Term Bond Pool except for \$5 million, which should remain in the West Virginia Money Market Pool.
2. That WVDEP develops plans to maximize the return on investment for future SR Fund revenue.

In October of 2013 the balance of \$28 million from the SRWTF was transferred to the Investment Management Board Fixed Income Pool.

In June of 2013, except for \$5 million, the balance of the Fund was transferred to the West Virginia Short Term Bond Pool. The following chart depicts the investment earnings for the previous six years prior to the new investment strategies and results of the new strategy leading up to the current year.

As of June 30, 2024, the Fund has accumulated assets of \$9.7 million, a 24.7% decrease from 2023 values, while the SRWTF has accumulated \$178.3 million in assets, a 15.2% increase over 2023 SRWTF values. Increased revenues for the SRWTF are attributed to the tax increase in 2012 as well as the improved investment strategy which was initiated in 2013 as described below.

Since 2001, despite a very aggressive reclamation schedule, the Fund has been serving the people of West Virginia well through providing for the reclamation of bond-forfeited (revoked) sites. From post-1977 time until legislation in 2001, there were 392 revoked permits requiring reclamation, including 122 requiring water treatment. Since passage of that legislation, an additional 277 permits have been revoked as well, bringing the total to 669 revoked permits requiring reclamation. Reclamation work remains on 236 sites, which includes ongoing water remediation sites. Regarding water treatment, the Fund is treating water at 156 sites and has an additional 36 sites under review or construction.

A complete inventory of all bond-forfeiture sites is in Appendix E, along with bond-forfeiture sites that have mine drainage related problems, and a prioritized order in which they will be addressed.

Graphic summaries of the status of the Funds are outlined in the following figures.

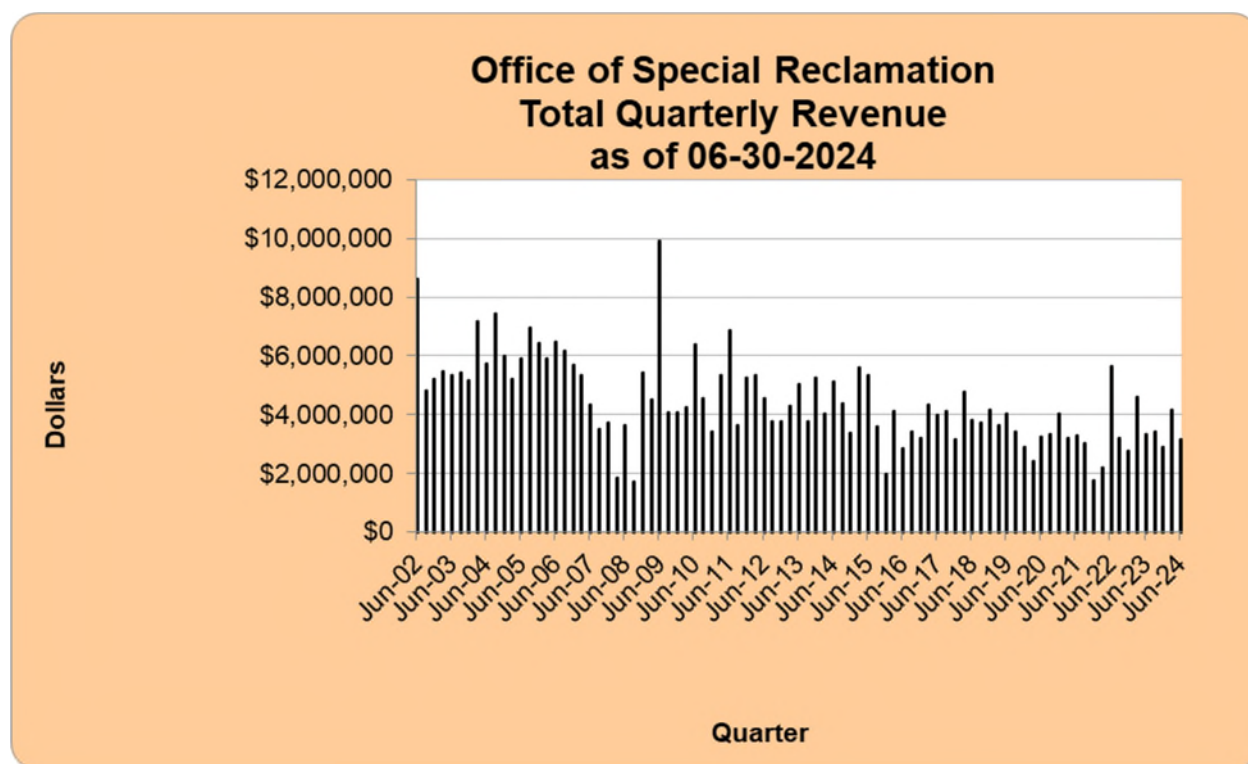

Figure 3

2024 SRF Advisory Council Annual Report

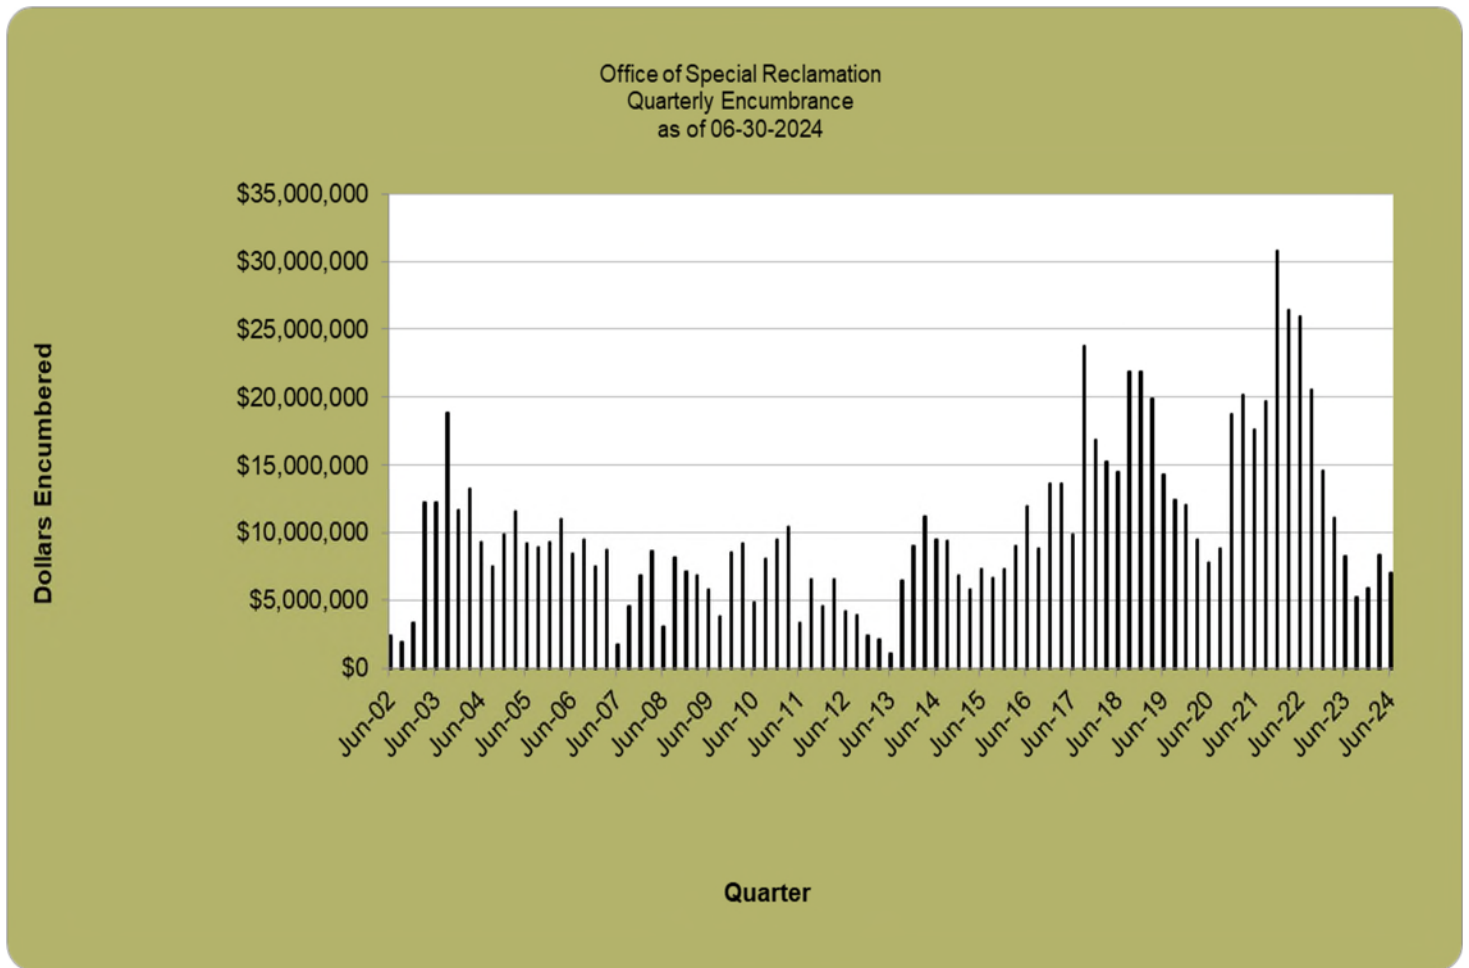

Figure 4

Figure 5

A complete inventory of bond-forfeiture sites that are producing mine drainage that violate effluent limitations or applicable water quality standards for long-term treatment of these sites are in Appendix E.

The current main funding mechanism for bond-forfeited (revoked) sites is the 27.9 cent tax per ton of clean coal mined, of which fifteen cents is dedicated to the SRWTF.

In 2008, the Legislature authorized, but did not separately fund, SRWTF. In reliance on the SRWTF statutory authorization, beginning in July 2008, coal tax revenues based on a tax rate of 1.5 cents per ton were being paid into the SRWTF. In addition, coal tax revenues based on 12.9 cents per ton were being paid into the

Fund. In 2012 the Legislature increased the amount dedicated to the SRWTF to 15 cents per ton; but based on the funded status of the Fund at the time the Fund remained at 12.9 cents per ton.

Increased water capital cost and water treatment cost are the result of two identical lawsuits filed against the WVDEP. In 2011 and 2012 the WVDEP entered separate consent decrees with the northern and southern district courts respectively. As will be discussed later in this report, WVDEP was required to apply for and obtain NPDES permits for all the sites included in the attachment of the consent decrees plus an additional 21 sites which were included in an earlier lawsuit, for a total of 192 sites. WVDEP has fulfilled the requirements of the Consent Decree by obtaining all NPDES permits. The WVDEP estimated that it would cost approximately \$35.5 million to bring bond-forfeiture sites into compliance with the more stringent water quality-based effluent limits. Additionally, WVDEP estimated that it would cost approximately \$6.7 million to operate and maintain these treatment systems on an annual basis. The SRFAC is continuing to look at alternatives for water treatment funding.

Additional Charges to The Fund Due to NPDES Requirements

Due to NPDES requirements in 2012, the WVDEP has been faced with charging more expenditures to the Fund. These include:

- Realty – Land and/or easement purchases have been necessary to expand existing or new water treatment sites outside permit boundaries. Surveying and appraisal costs are included in these purchases.

Increased staff – As a result of having to apply for and obtain NPDES permits at all bond-forfeiture sites now and into the future, the WVDEP has found it necessary to incorporate an NPDES permitting section into the Office of Special Reclamation (OSR - The office responsible for reclamation of land and waters for bond-forfeited (revoked) sites). Five new staff members, consisting of one (1) Program Manager and four (4) field staff personnel, have been added to fulfill the NPDES requirements for the WVDEP. Additionally, to reduce surveying costs associated with realty needs and design, a licensed surveyor was hired.

Also, two (2) land agents were hired in 2018 to address realty needs, although the responsibilities and salaries are split between OSR and the Office of Abandoned Mine Lands.

2024 SRF Advisory Council Annual Report

- NPDES permitting fees:
 - Application fees - \$1,000/application
 - Modification fees - \$2000/Major.mod. and \$1000/minor
 - Annual fees - \$2000/permit.
 - Reissuance fees - \$ 3000/permit
- Additional water sampling related to permit applications.
- WVDEP entered into a grant agreement with the West Virginia Land Stewardship Corporation (WVLSC) to provide contractual services in the areas of design, construction, and project oversight. The purpose of the agreement was to enhance the capacity of WVDEP professional staff to meet reclamation deadlines. It is estimated that project costs will increase by 10 to 15% for contractual services and another 1% for indirect costs associated with managing the grant. The WVLSC was created by state legislation in 2013 to lessen the burdens of government when government identifies a need for WVLSC to assist with land stewardship and the remediation of properties with known environmental issues, including former mining sites.

A pilot grant agreement, known as the LaRosa Fuels site (Permit Number S-1051-86), was approved in 2016 to evaluate the efficiency and benefits of a work-sharing partnership.

WVDEP approved a grant amendment in 2017 and provided additional funds, as well as additional permits to be reclaimed. The grant was structured as an up-front payment to provide the WVLSC with the funds needed to cover the level of liability inherent in multiple reclamation projects, which require engaging multiple engineering and construction firms simultaneously. Having the resources to cover at least the original liability estimates provided by WVDEP gave the WVLSC Board the level of certainty it needed to take on the project.

The WVLSC invested the grant funds so that they could earn interest that could be used on the project. In 2018, when it was identified that WVDEP investments were gaining a higher rate of return, the grant funds were returned to the WVDEP to maximize investment earnings. The WVLSC invoices WVDEP when expenditure regularly occurs. WVLSC had one design project in 2021 to fulfill the grant agreement, which was completed before the end of the year, and the agreement was terminated.

WVDEP Policy Relevant to the Fund

Effective May 21, 2014, the WVDEP has implemented a new policy establishing a standard procedure the WVDEP will follow to terminate the State's jurisdiction over bond-forfeited (revoked) former mining sites (Special Reclamation Sites). With a decision that the Special Reclamation Site has satisfied the applicable performance standards, WVDEP will terminate jurisdiction over the subject Special Reclamation Site. The policy limits the vulnerability of the State, and consequently the Fund, by reducing the possibility of lawsuits pertaining to damages unrelated to former mining practices or reclamation practices, i.e., due to recreation, timbering, oil & gas, etc., as well as any changes to environmental laws taking effect after reclamation of the subject Special Reclamation Site. WVDEP will retain jurisdiction of Special Reclamation Sites, or portions thereof, that are necessary for the effective treatment of mine discharges emanating from the subject Site. At the end of FY2024, the WVDEP terminated jurisdiction on 49 sites.

LITIGATION

1. The Fund through FY 2018 and the SRWTF starting in FY 2019 has acquired liability for additional water treatment because of lawsuits filed against the WVDEP, as described below.

Identical complaints were filed in the Northern and Southern District Courts, Civil Actions No. 07-cv-87 (the "Northern District Case") and No. 2:07-0410 (the "Southern District Case"), assigned to Judge Irene Keeley and Judge John T. Copenhaver, Jr., respectively. Both cases were styled *West Virginia Highland Conservancy and West Virginia Rivers Coalition v. Randy C. Huffman, Secretary, West Virginia Department of Environmental Protection*.

The two suits alleged that the West Virginia Department of Environmental Protection (WVDEP) had violated, and continued to violate, the federal Clean Water Act (the Act) by failing to obtain West Virginia National Pollutant Discharge Elimination System (WV/NPDES) permits when the WVDEP reclaims and treats water at bond-forfeited (revoked) sites as directed by state law. The Northern District Case named 18 specific bond-forfeited (revoked) sites, and the Southern District Case named 3 sites.

On March 26, 2009, the Northern District Court entered summary judgment in favor of Plaintiffs in the Northern District Case and granted a permanent injunction. The injunction requires WVDEP to apply for, process,

and issue WV/NPDES permits itself for the discharge into waters and streams of pollutants from the eighteen bond-forfeited (revoked), coal mining sites at issue in the case, whose reclamation the agency is required to manage. WVDEP appealed this decision to the United States Court of Appeals for the Fourth Circuit (“Fourth Circuit Court of Appeals”). By order dated November 8, 2010, the Fourth Circuit Court of Appeals affirmed the Northern District Court’s ruling.

Similarly, a motion for summary judgment in the Southern District Case was granted by Order dated August 24, 2009. The Southern District Court found that the Secretary of the WVDEP was “in violation of the National Pollutant Discharge Elimination System permitting requirements of the Clean Water Act.” The Southern District Court ordered the Secretary to “apply for, and obtain, NPDES permits for all sites at issue in this action,” and the parties subsequently submitted a joint stipulation agreeing to the same injunctive relief and timeframes for compliance set forth in the Northern District litigation. The Southern District Court entered final judgment on August 31, 2010.

On January 11, 2010, the same Plaintiffs (West Virginia Highlands Conservancy and West Virginia Rivers Coalition) and the Sierra Club submitted a letter giving WVDEP notice of their intent to sue WVDEP regarding discharges from 131 additional bond-forfeited (revoked) sites on the same legal basis as the previous suits. Based on the outcome of the previous litigation, WVDEP engaged in settlement negotiations with the Plaintiffs and reached agreement regarding the permitting of the 21 sites in the previous litigation and the additional 131 sites. In August 2011, the Plaintiffs filed two new suits regarding the additional sites, *West Virginia Rivers Coalition, et al v. Huffman*, Civil Action No. 1:11-cv-118 (N.D. W.Va.), and *West Virginia Rivers Coalition, et al v. Huffman*, Civil Action No. 2:11-cv-524 (S.D. W.Va.) and lodged a proposed Consent Decree with both courts. The Northern District Court entered the Consent Decree on October 12, 2011. The Southern District Court entered the Consent Decree on February 10, 2012. A list of all bond-forfeited (revoked) sites at issue in all four suits is attached to the Consent Decree as Attachment A. As required by the Consent Decree on July 2, 2012, WVDEP submitted a Final Treatment Cost Report to Plaintiffs and SRFAC, in which WVDEP determined the capital cost and annual operating and maintenance costs for water discharges from each bond-forfeiture site to meet applicable water quality-based effluent limitations. WVDEP estimated that these costs will amount to \$35.5 million for one-time capital construction costs and over \$6 million in annual operations and maintenance costs.

The Consent Decree resolves all four suits filed by the Plaintiffs regarding bond-forfeited (revoked) sites. The Consent Decree required WVDEP to obtain WV/NPDES permits for all 21 bond-forfeiture sites cited in the

initial litigation by September 1, 2011. Thereafter, WVDEP issued draft WV/NPDES permits for 50 additional sites by the end of each calendar year, beginning in 2012. By December 31, 2015, the Consent Decree required WVDEP to issue draft WV/NPDES permits for all bond-forfeited (revoked) sites listed in Attachment A of the Consent Decree and for sites that were in existence on the date the Decree was executed. Thereafter, the WVDEP shall exercise its best judgment on the timing of issuance of draft permits for sites forfeited (revoked) after the execution of the consent decree. The final draft permit was issued December 10, 2015.

2. A third case presents potential for future litigation, should the legislature not adequately fund the Fund and SRWTF. *West Virginia Highlands Conservancy v. Secretary Salazar, DOI*, Civil Action No. 2:00-1062 (S.D. W.Va.). The West Virginia Highlands Conservancy (WVHC) had filed a motion with the U.S. District Court for the Southern District of West Virginia to reopen the case and schedule further proceedings on the grounds that the recommendations of the SRFAC were not being followed regarding funding the Special Reclamation Fund. Based upon the Legislature's extension of funding through the Continuing and Temporary taxes, the case was placed on the court's inactive docket as of May 2008; however, the court allowed the possibility of a renewed motion if the Legislature does not continue to provide sufficient monies for the Fund to remain solvent.

In March 2011, the WVHC moved once again to have the litigation reopened alleging continuing problems with the Fund. A status conference was held on August 5, and the court ordered the filing of a joint status report. On August 25, 2011, the WVHC and the Defendants filed a joint status report with the court. The WVHC stated that the court should not delay reopening the case until the new actuarial report and SRFAC recommendations are issued, whereas the Defendants recommended that it was premature for the court to reopen this matter prior to the close of the 2012 legislative session.

On March 30, 2012, a status conference call was conducted by the Court. Considering the enactment of Senate Bill 579 that increased the special reclamation tax from 14.4 cents to 27.9 cents per ton of clean coal mined, the Plaintiff acknowledged that it would move to withdraw its Second Motion to reopen and refile it to address the changed circumstances that have occurred since the filing of its motion to reopen.

On April 2, 2012, the WVHC filed its Motion to withdraw its Second Motion to reopen this case with the Court. On April 5, 2012, the Court issued an Order granting the Plaintiff's Motion to withdraw its Second Motion. In addition, the Court granted the WVHC leave to file an additional motion to explain deficiencies that remain,

notwithstanding the recent revenue increase in the Special Reclamation Fund. The case was closed March 11, 2003.

3. On or about April 20, 2016, the West Virginia Highlands Conservancy, West Virginia Rivers Coalition, and Sierra Club sued the West Virginia Department of Environmental Protection's (WVDEP) Special Reclamation Program alleging it was in violation of seven West Virginia National Pollution Discharge Elimination System (WVNPDES) permits issued for sites controlled by the Special Reclamation Program, four in the United States District Court for the Northern District of West Virginia¹ and three in the Southern District². The lawsuits allege that the WVDEP had discharged and continued to discharge quantities of aluminum, iron, nitrogen, ammonia, and suspended solids more than the effluent limitations in those permits. The lawsuits further allege discharges of effluent with pH outside of the permit range. On December 12, 2016, the parties met at WVDEP's headquarters in Charleston. The WVDEP explained to the Plaintiffs that a timetable for achieving compliance had already been established and were included in a corrective action plan required under the enforcement actions being carried out by the WVDEP's Division of Mining and Reclamation. On July 10, 2017, the parties filed a consent decree in the Northern District action. On April 25, 2018, the parties filed a consent decree in the Southern District. The compliance requirements found in these consent decrees are based on the schedule that the WVDEP had prepared for inclusion in the corrective action plan; no new or different requirements were added because of the litigation.

4. On June 29, 2021, Appalachian Mountain Advocates, on behalf of Sierra Club, West Virginia Highlands Conservancy, and West Virginia Rivers Coalition, delivered to the West Virginia Department of Environmental Protection ("WVDEP") a Notice of Intent ("NOI") to sue for violations of the Clean Water Act regarding WV/NPDES Permit No. WV1027301, which is associated with the Greendale bond-forfeiture site operated by the WVDEP Office of Special Reclamation. Discussions between the parties have resulted in no further legal action being taken by either party to date.

5. *Living Lands, LLC and D.C. Chapman Ventures, Inc. v. Jack Cline, Brady Cline Coal Co., Spruce Run Coal Co., Harold Ward, Secretary, West Virginia Department of Environmental Protection, Civil Action No. 3:20-cv-00275*, revolves around three primary claims. The first of which being that unlined treatment ponds, unlined AMD sludge drying pits for treated sludge, and unlined conveyance ditches allow for infiltration and pollution of groundwater; therefore, point sources require individual NPDES permits. The second being that the material in the treatment ponds and the treated sludge in the sludge drying pits are hazardous waste and/or solid

waste under RCRA, therefore triggering the relevant waste handling and disposal requirements. The third being that the material in the unlined treatment ponds, unlined sludge drying pits, and unlined conveyance ditches is AMD contaminated mining waste under CERCLA, therefore triggering financial responsibility for potential responsible parties, including but not limited to the DEP.

The implications of DEP losing on the first issue would be that similarly situated ponds across the state of West Virginia could be required to install liners and obtain NPDES permits, at a huge cost. A loss on the second issue would completely upend how the DEP, and all other entities who generate, store, or dispose of AMD sludge currently operate. A loss on the third issue would expose the DEP, as well as any other potential responsible parties in the handling history of the material, to massive financial liability for the cleanup and remediation of this site, and very likely many others. A loss on any of these claims is likely to impact similar operations in other states, as a precedent would allow for similar challenges in courts across the nation.

The case was set for trial in the United States District Court for the Southern District of West Virginia, before Judge Robert C. Chambers, on November 1, 2022. The Court has scheduled oral arguments on outstanding issues on January 30, 2023. Upon Motion made by WVDEP, Plaintiff's claims against WVDEP were dismissed in their entirety by the Court.

6. *Living Lands, LLC and D.C. Chapman Ventures, Inc. v. Harold Ward, Secretary, West Virginia Department of Environmental Protection*, Civil Action No. 3:24-cv-00356, revolves around two primary claims: (1) that an unlined conveyance ditch allows for unpermitted discharges in violation of the Clean Water Act and (2) that untreated AMD is being discharged into a treatment pond in violation of the NPDES permit and the Clean Water Act. The DEP accepted service of the complaint on August 26, 2024, and the DEP's responsive deadline is October 22, 2024.

2025 SRFAC STUDY TOPICS

- Continue to review the current investment strategy.
- Continue to improve upon the active mine pollutant inventory.
- Review coal refuse impoundment liabilities and review the required balance in the Water Trust Fund to support long term treatment obligations.
- Review Operations & Maintenance costs at active water treatment sites

The SRFAC is continuously looking for ways to improve the ability to project future bond-forfeitures (revocations). Although limited in its current form, the DMR database of open permits is the primary source of information used for the biennial actuarial analysis of the SRF and SRWTF. The analysis also relies heavily on information obtained from bond-forfeited (revoked) permits and applied to current permits to project future bond-forfeitures (revocations).

The SRFAC would like to explore options to increase the linkages of data from past bond-forfeitures (revocations) to open permits, to improve the predictive power of historical data. Some pieces of data that may be available in the permit databases that have not been previously utilized include:

- length of time a permit had a particular status
- number of times a permit changed status
- groupings with other permits (proximity or use), including Parent Company level of existing permits
- annual coal production associated with a permit or group of permits

SRFAC recognizes that not all these pieces of data are available, even on open permits, and may no longer be available for permits that bond-forfeited (revoked) many years ago but would like to explore the ability to enhance the information available that can help quantify risk. The database will need to be cleaned and augmented prior to future in-depth study.

The SRFAC would like to recognize the WVDEP for their conscientious management of the Fund and the SRWTF and their efforts in minimizing the impacts of bankruptcies on the Funds.

Abstract

Acid mine drainage (AMD) from historic, unregulated mining in the eastern U.S. Appalachian Coal Basin has impaired thousands of stream miles. In contrast, federal and state regulations enacted in 1977 distinguished between these unregulated or abandoned coal mine lands (AML) and post-1977 or regulated discharges. The regulations also required high standards of treatment for regulated, point-source discharges. Untreated AML discharges often contribute over 80% of the AMD load to watersheds, resulting in ongoing impairment despite significant investment in the treatment of regulated discharges. This project evaluated watershed-scale restoration (WSR) with the objective of restoring the designated uses to a given watershed by treating AMD from both AML and regulated discharges based on their load contribution and the cost per recovered stream length. Results were compared to pre-project impairment levels and costs. Despite higher capital costs for WSR, lower operating costs resulted in net savings over the point source treatment strategy. Most significantly, while proving more expensive over the long term, treatment of only regulated discharges resulted in the recovery of zero stream miles. Managing AMD treatment from a watershed scale rather than at regulated discharges only may produce superior economics in similar watersheds. Furthermore, restoration is achieved more quickly with more stream miles recovered.

Keywords Mining, watershed restoration, Appalachia, water quality, economics, acid mine drainage

Introduction

Acid mine drainage (AMD) is a global pollution issue resulting from mineral extraction activities. Sulfide minerals, commonly associated with metal ores and coal seams, produce AMD when exposed to an oxidizing environment through mining processes. AMD impairs streams with acidity, sulfate, and metals such as iron and aluminum (Skousen et al. 2019). In the United States, approximately 12,400 stream miles are affected by AMD, with roughly 2,500 impaired stream miles in West Virginia (Skousen et al. 2019). Traditional AMD treatment occurs at the source where it exits the ground via a mine portal opening or a seep. Treatment generally includes the addition of an alkaline agent for pH adjustment and oxidation to allow for the precipitation of metal hydroxides. Severe sources of AMD are typically treated with continuous additions of an alkaline chemical reagent in what is known as 'active' treatment, whereas less significant sources utilize 'passive' treatment consisting of biological or geochemical processes. Common components of passive treatment systems include constructed wetlands, open limestone channels, limestone leach beds, and settling ponds (Skousen et al. 2016). Active treatment systems vary from in-

stream dosers to more expansive treatment systems which may consist of a chemical doser as well as limestone channels, aerators, mixing tanks, clarifiers, and settling ponds.

The 1977 Surface Mining Control and Reclamation Act (SMCRA) created separate programs for reclaiming abandoned mine lands (AML) (pre-1977) and regulating active coal mines (post-1977). However, there is often a combination of several AML and regulated mine sites within each watershed. The West Virginia Department of Environmental Protection's (WVDEP) Office of Special Reclamation (OSR) is responsible for treating AMD discharges from post-1977 coal mines that have transferred their surety bonds and water treatment liabilities to the State. Known as bond forfeiture sites, the cost of treating these AMD discharges to Clean Water Act (CWA) standards is high, and unfortunately, the treated water is commonly discharged to streams that are severely impaired due to AMD from AMLs. Thus, the expense of treating bond forfeiture sites rarely results in stream restoration benefits. Dimensioning efficiency as stream length restored per unit cost, there has been a recent effort toward improving the environmental performance of watershed investments utilizing watershed-scale restoration (WSR) (Leitgeb 2022; Petty et al. 2008; Throuth et al. 2011). In addition to in-stream dosers, WSR taps flooded underground mine pools to transport AMD to a conventional AMD treatment facility where large volumes of AMD can be treated efficiently. This shifts treatment away from often small discharges with high capital and operating costs relative to benefit. Compliance with watershed restoration objectives is then measured at a point downstream in the watershed rather than at the point where the discharge leaves the bond forfeited property. WSR requires strategic planning and multi-organization cooperation to remediate impaired streams with strategically placed treatment.

The West Virginia Water Research Institute (WVWRI) and the West Virginia Department of Environmental Protection (WVDEP) partnered to study the watershed-scale approach to treatment as early as 2008. As a result of a cost and ecological benefit study in the Three Fork Creek watershed, four in-stream dosers were constructed by the WVDEP Office of Abandoned Mine Lands (WVDEP AML) in strategic locations following recommendations from the study (Petty et al. 2008). Three Fork Creek has recovered successfully, and as a result, was removed from the state 303(d) list of impaired waters for dissolved aluminum impairment in 2014 (WVDEP 2014). The WSR approach was later applied in the Muddy Creek watershed (Figure 1), where OSR had been treating several forfeited mine sites to discharge standards without achieving measurable improvements in the receiving streams. The treated water represented less than 5% of the AMD load in Muddy Creek and flowed into streams that had a pH near 3.0 due to the extent of AML sources in the watershed. Therefore, full restoration would be impossible if only regulated discharges were treated. In late 2015, the WVDEP commissioned WVWRI to perform a comparison of the costs and benefits of in-stream and point-source AMD treatment in Muddy Creek. The performance of WSR via in-stream dosing was evaluated by dosing impaired tributaries over a one-year period, monitoring water quality in response to treatment, and comparing results to restoration targets. The study found that in-stream dosing, paired with planned restoration projects, would restore 3.4 miles of Muddy Creek and cost less than the current at-source treatment projects which restored zero stream miles.

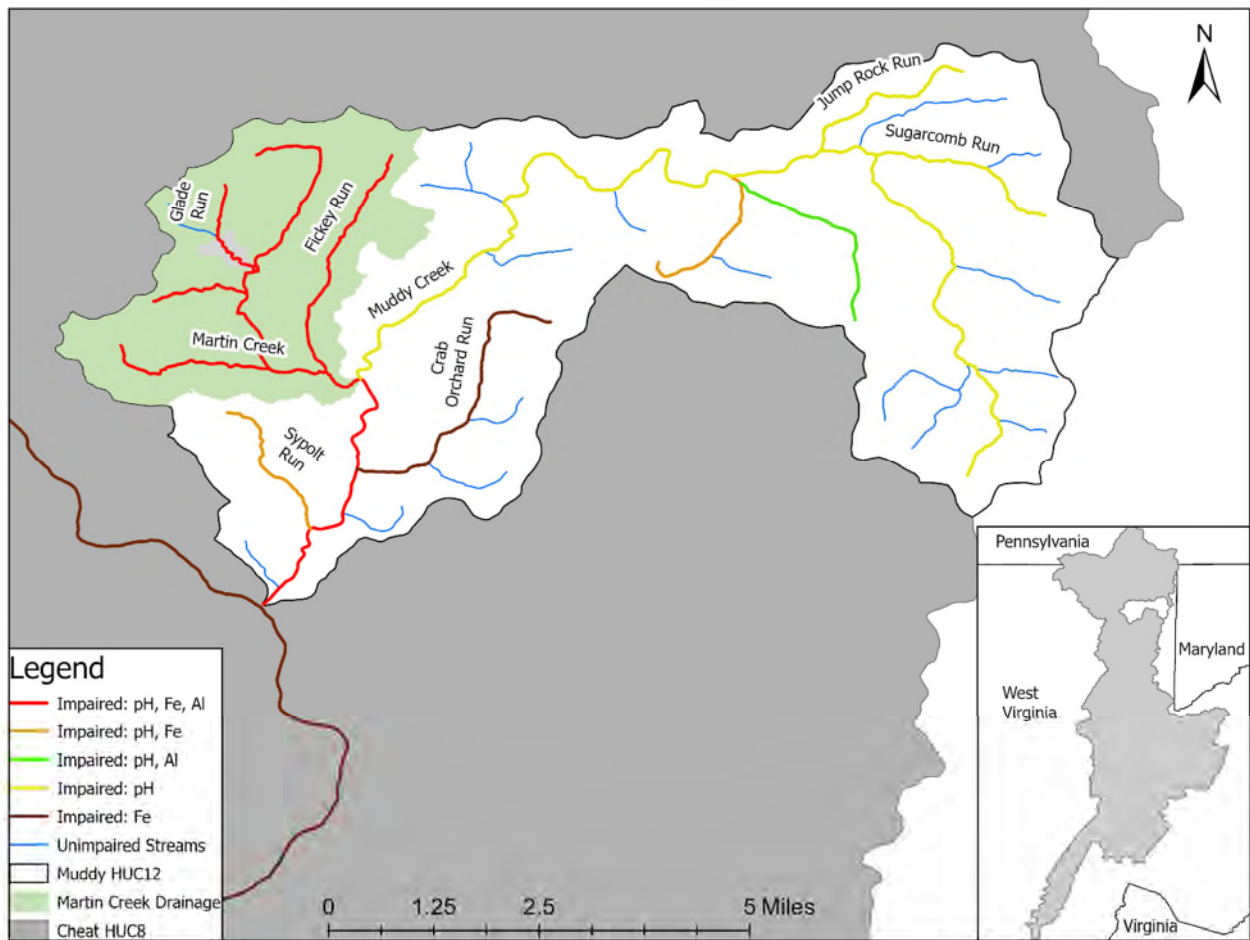

Fig. 1 Location of the Muddy Creek watershed and its stream impairments (WVDEP 2016a)

In 2017, the U.S. Environmental Protection Agency (EPA) approved a variance pursuant to CWA §303(c) and the implementing regulation of 40 CFR §131, allowing for an innovative permitting strategy to implement watershed-scale treatment in the Muddy Creek watershed in order to provide optimal water quality improvements where the designated use and criterion were previously unattainable (Cooper 2017). The variance permitted the treatment of bond forfeiture sites and abandoned mine lands together and provides instream interim water quality criteria which the WVDEP follows in its in-stream National Pollutant Discharge Elimination System (NPDES) permit at the mouth of Martin Creek. A key basis for the variance was the WVVRI study (WVDEP 2015), from which the WVDEP determined that the most effective treatment with the least amount of inadvertent impact to the stream was the use of instream lime dosers in combination with the construction of a centralized treatment facility.

Following these recommendations, WVDEP OSR, with the help of capital and operating contributions from Southwestern Energy (SWE), constructed a large treatment facility along Muddy Creek approximately 0.5 miles downstream of the confluence of Martin Creek, the highest contributor of AMD in the watershed, contributing over 24,000 lbs/yr of iron and 956 tons/yr of acidity (WVDEP 2011). In March of 2018, the Muddy Creek system (also commonly referred to as T&T) went online. The T&T facility treats AMD from four bond forfeiture sources, including three partially flooded, deep mines and one surface mine. These sources include T&T Fuels #2, Preston Energy, Viking Coal Company, and Mary Ruth Corporation. In addition, approximately 250 gallons per minute of pre-1977 AML water from a refuse coal area and one deep mine are conveyed from the headwaters of Fickey Run to the facility. The system, which has a capacity of approximately 4,500 gallons per minute, is a replacement for point-source treatment at these locations. It features an advanced computer automation system and utilizes lime slurry, polymers, a mixing tank, and two clarifiers to raise pH and remove metals. Clean water is then returned to Muddy Creek in a continuous

flow. Two in-stream lime slurry dosers located in the tributaries of Glade Run and Martin Creek provide additional treatment within the watershed. The Glade Run doser has been in place since its installation in late 2015 for the doser trial study, while the Martin Creek doser was installed in 2022.

Study Area

Muddy Creek is a 15.9-mile tributary of the Cheat River that drains 21,487 acres located in northern West Virginia (Fig. 1). Approximately 3.4 stream miles in the Muddy Creek drainage are impaired by AMD. Most of the acid load comes from the Martin Creek sub-watershed, including Fickey Run and Glade Run. According to the Lower Cheat River Watershed Based Plan, Fickey Run is impaired by two abandoned mine land (AML) and two bond forfeiture (BF) sites, while Glade Run is impaired by five AML and five BF sites (Friends of the Cheat 2020). Both Fickey Run and Glade Run flow into Martin Creek, which receives AMD from two AML sites before it joins Muddy Creek 3.2 miles above its confluence with the Cheat River. Muddy Creek, Martin Creek, Glade Run, UNT/Glade Run RM 1.06, and Fickey Run had total maximum daily loads (TMDLs) developed for aluminum, iron, and pH in 2011 (WVDEP 2011). These streams have been placed in Category 4a, for waters that already have an approved TMDL but are still not meeting standards, in the most recent USEPA-approved state Integrated Water Quality Monitoring and Assessment Report (WVDEP 2016a). Apart from the Martin Creek subwatershed, the Muddy Creek watershed is minimally impacted by AMD. Muddy Creek is a designated partial trout stream from its headwaters to its confluence with Martin Creek (WVDEP 2016a).

Fundamental to our approach is data collected by the WVDEP Watershed Assessment Branch (WAB), now known as the Water Quality Standards and Assessment Section, in coordination with OSR and in compliance with directives within the EPA-approved variance. Water chemistry monitoring occurred throughout the watershed, while macroinvertebrate surveys occurred at the mouths of treated streams, and fish surveys occurred on the mainstem of Muddy Creek. Where possible, only sites with pre- and post-treatment data were included in this study. Six water chemistry sites were selected. Among these six sites, four sites also included pre- and post-WSR macroinvertebrate surveys and two included pre- and post-WSR fish surveys. Two sites with limited fish monitoring data were included due to survey constraints. In total, seven sites were considered in this study (Fig. 2). The mouth of Muddy Creek was the only site with all three data types (chemical, macroinvertebrate, and fish surveys). This site included data from river miles (RM) 0.0 and 0.1 due to the proximity of the sites. Similarly, Muddy Creek 4.4 incorporated data collected at RM 4.6. Site 4.4 is upstream of the main AMD disturbances within the watershed and was used as a control station for comparative purposes.

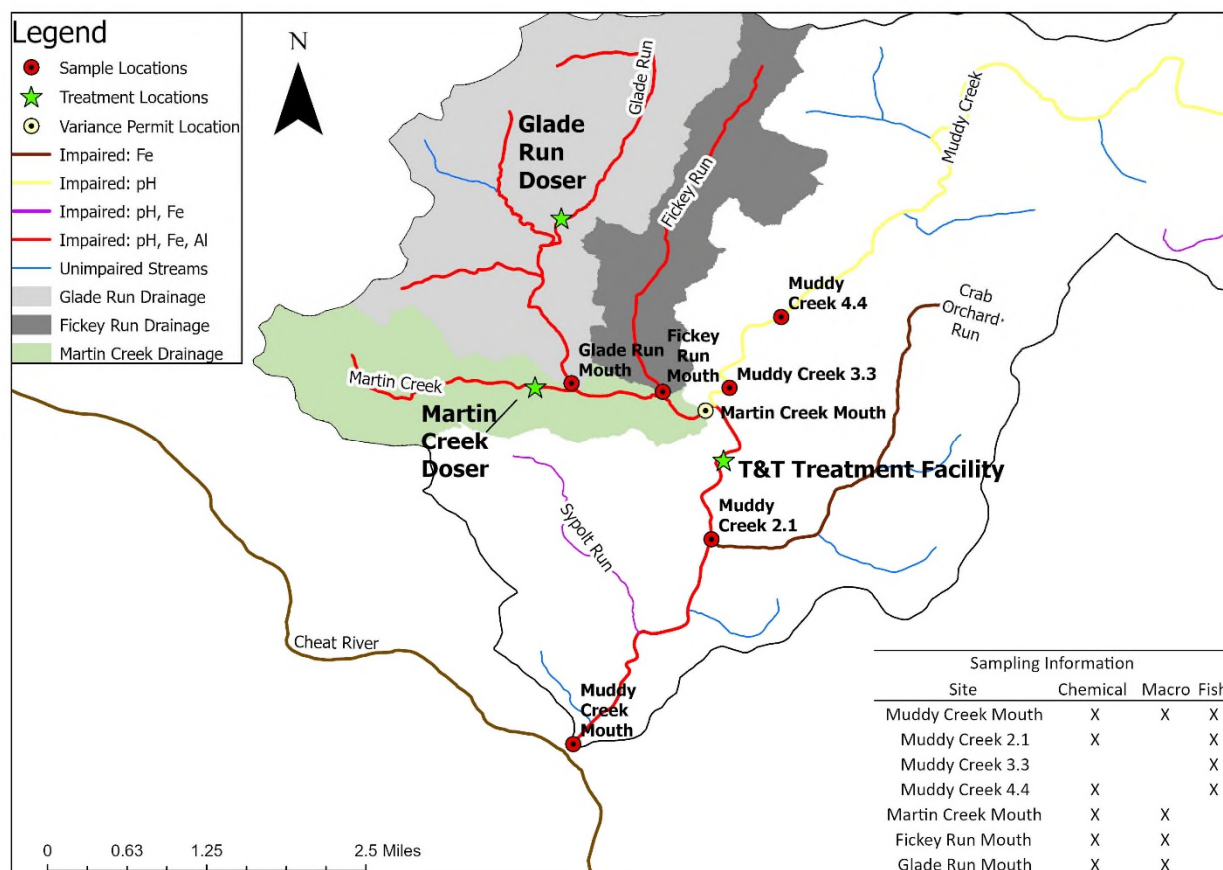

Fig. 2 Sampling and treatment facility locations within the Muddy Creek watershed

Methods

Ecological Analysis

Muddy Creek watershed data included pH (su), specific conductance ($\mu\text{S}/\text{cm}$), total aluminum (mg/L), total iron (mg/L), total manganese (mg/L), and sulfate (mg/L) from the WVDEP Water Quality Data Report (WVDEP 2023). One-half of the method detection limit for a particular analyte was substituted into the dataset whenever concentrations were reported as less than the detection limit (Fu & Wang 2012). Fish surveys and macroinvertebrate data were obtained from the WVDEP Water Quality Data Report – Benthic as well as personal communications (WVDEP 2023). Macroinvertebrate data were reported as West Virginia Stream Characterization Index (WVSCI) scores and EPT. EPT is an index that can be expressed as a percentage of the sensitive orders (E=Ephemeroptera, P=Plecoptera, T= Tricoptera) to the total taxa found. A large percentage of EPT indicates good water quality (Weber 1973). Additional WVSCI scores were gathered from two other studies in the watershed that followed the USEPA’s rapid bioassessment protocols for wadable streams and rivers (Carlson 2013; Watson & Merovich 2014). These samples were collected at the same WVDEP locations: Muddy Creek Mouth, Martin Creek Mouth, Fickey Run Mouth, and Glade Run Mouth. These additional data were necessary to contribute additional pre-treatment data.

Chemical and macroinvertebrate data were classified by sample location. Data were then categorized into two periods for each site, pre-treatment (1996 - 2014) and post-treatment (2018 - 2022). Any data collected in the years 2015 to 2017 were excluded due to trial runs of the instream dosers, which resulted in variability of data from dosers running, malfunctioning, and being moved. If a sample site did not have both pre- and post-treatment data, it was excluded from this study. Fish survey data were not categorized or statistically analyzed due to the limited number of studies completed within the watershed.

Water quality and macroinvertebrate box plots were produced to provide visual summaries of data for exploratory analysis. Box plots show the median (centerline), the variation or spread (interquartile range - the box height), the skewness (quartile skew - the relative size of box halves), and the presence or absence of unusual values and their magnitudes (outliers). A simple Mann-Whitney U test was performed on water quality and macroinvertebrate data to determine if the means of each period for each parameter were significantly different. A hypothesized mean difference of zero and an Alpha of 0.05 was set using the standard normal distribution. P values less than 0.05 indicate a significant difference between pre and post treatment. Results are shown in table form.

Economic Analysis

The operations and maintenance (O&M) costs used in the economic calculations are based on costs incurred by OSR from 2017 to 2023 and on estimates of what the point-source configuration would have cost over that same period. All construction and O&M costs, as well as projected costs for the installation of a sludge pump line, were obtained from personal communications with the WVDEP. Values from years prior to 2023 were adjusted using producer price indexes (PPIs) produced by the Bureau of Labor Statistics (BLS) and are denoted as \$2023. The index data were adjusted to use 2023 as the base year. The series "PPI industry data for new industrial building construction, not seasonally adjusted" (base year 2007) was used to adjust capital expenditures for the watershed system and estimates of capital costs for the point-source system. The series "PPI industry group data for Waste collection, not seasonally adjusted" (base year 2003) was used to adjust O&M expenditures. The PPI Commodity for All Final Demand index values were used to adjust Southwestern Energy's cash contributions to represent relative purchasing power in 2023. All PPIs used in this study are included in Appendix 1.

For O&M costs with multiple years of data (the T&T plant, the Glade Run doser, and the Martin Creek doser) the average cost through FY 2023 was used. For O&M costs, OSR expenditure data were reported for fiscal year (FY) and indexes were an average of the two calendar years (CY) included in the FY. For comparison, capital costs were modeled as having occurred in year zero of the project when expenditures took place over several years (between 2017 and 2024). Similarly, all O&M costs were modeled as having begun in year one. Some estimates of point-source configuration were old, as early as 2011, and may have been less accurate than recent estimates as they have not been tried with contractual agreements. However, for capital costs these estimates were likely to be lower than actual costs, based on DEP's self-reported variances over the years, making them conservative. Abandonment costs to remove the original point-source treatment units (largely dosers) built in the early 2000s were not included in the analysis, as the purpose is to compare the differences between building and operating the two systems.

Results

The result of this comparison is specific to the watershed scale approach. We do not compare pre to post point source treatment or post watershed to post point source treatment. Results are present for water quality, biological indicators, and economic analysis. A summary of results from the Mann-Whitney U test is displayed in Table 1. Parameters with a p-value less than 0.05 are considered significantly different.

Table 1 Results from Mann-Whitney U Test including sample count, pre- and post-treatment averages, z-test statistics, and p-value for each parameter completed at each river section within the study area

Stream Section	Parameter	Sample Count		Mean		z test Statistic	p-value	Significant?

Water Quality

The data showed significant improvements in water quality at all sites downstream of the treatment facilities for most parameters, which can be seen in the figures below for pH (Fig. 3), sulfate (Fig. 4), and metals (Fig. 5). The mouth of Muddy Creek displayed the largest, most significant improvement in pH, with substantial improvements in aluminum, iron, and manganese. The pre-treatment pH mean was 4.3 while the post-treatment mean was 7.3 ($p < 0.0001$). There was no significant change in sulfate at Muddy Creek Mouth with a pre-treatment mean of 305 mg/L to 263 mg/L post-treatment ($p = 0.7963$). Mean aluminum

concentrations at the mouth of Muddy Creek were reduced by 83% from 8.10 mg/L pre-treatment to 1.37 mg/L post-treatment ($p=0.0004$). Mean iron concentrations were reduced by 88% from 8.22 mg/L to 1.02 mg/L ($p=0.0001$). Manganese concentrations were reduced by an average of 59% from 1.78 mg/L to 0.73 mg/L ($p<0.0001$).

Upstream of Muddy Creek Mouth, continued changes in water quality were documented. At Muddy Creek 2.1, there were significant improvements for every chemical parameter except sulfate. pH increased from a mean of 4.2 to 7.0 ($p=0.0007$). Sulfate mean concentrations were not significantly different with means of 244 mg/L for pre-treatment to 272 mg/L post-treatment ($p=0.6630$). Aluminum concentration means decreased by 76% from 8.28 mg/L to 1.96 mg/L ($p=0.0007$). Iron decreased by 85% from a mean of 9.50 mg/L to 1.44 mg/L ($p=0.0003$). Mean manganese decreased 39% from 1.58 mg/L to 0.97 mg/L ($p=0.0341$).

The control site, Muddy Creek 4.4, had no significant change in pH, aluminum, and iron. The mean pH before treatment was 7.3, while after the treatment period, pH was 7.5 ($p=0.5542$). Mean sulfate concentrations were 74 mg/L pre-treatment and 41 mg/L post-treatment ($p=0.0312$). Mean aluminum concentrations decreased by 51% from 0.29 mg/L before treatment to 0.14 mg/L post-treatment ($p=0.0546$). The mean iron concentrations for pre-treatment were 0.18 mg/L and 0.14 mg/L after treatment ($p=0.6573$), a decrease of 30%. Mean concentrations of manganese were decreased by 74% from 0.11 mg/L to 0.03 mg/L after treatment ($p=0.0272$).

Martin Creek Mouth saw significant changes in pH, aluminum, and iron. pH increased from 3.2 to 5.1 when comparing pre- and post-treatment means ($p=0.0010$). No significant change in sulfate was observed, with a pre-treatment mean of 617 mg/L to 570 mg/L ($p=0.5633$). Mean aluminum decreased by 70% from 22.54 mg/L pre-treatment to 6.84 mg/L post-treatment ($p=0.0026$). Changes in mean iron concentrations decreased by 90% from 21.08 mg/L to 2.11 mg/L ($p=0.0011$). Finally, a decrease of 51% from 5.97 mg/L to 2.95 mg/L of manganese occurred from the pre-treatment to the post-treatment period ($p=0.1439$).

Fickey Run Mouth saw a significant increase in pH from an average of 2.8 to 3.2 ($p=0.0036$). Additionally, mean metal concentrations significantly decreased post-treatment. Iron means were reduced by 93% from 80.33 mg/L to 5.84 mg/L ($p=0.0010$). Aluminum was reduced by 61% from 40.0 mg/L to 15.5 mg/L ($p=0.0036$). A reduction of manganese from 7.69 mg/L to 2.75 mg/L, a 64% decrease was calculated ($p=0.0415$). Sulfate did not display a significant change from a mean of 1,292 mg/L to 632 mg/L ($p=0.4615$).

Finally, Glade Run Mouth did not see significant changes in sulfate, iron, or manganese when comparing means for pre- and post-treatment. The mean pH increased from 3.4 to 6.4 ($p=0.0014$). Sulfate had a pre-treatment mean of 509 mg/L and a post-treatment mean of 356 mg/L ($p=0.5982$). Total aluminum decreased by 52% from 18.5 mg/L to 9.0 mg/L ($p=0.0417$). The iron means decreased 29% from 2.5 mg/L to 1.8 mg/L ($p=0.2472$). Finally, manganese decreased by 35% from 6.3 mg/L to 4.1 mg/L ($p=0.2664$).

Biological Indicators

Macroinvertebrate surveys were completed at the mouths of Muddy Creek, Martin Creek, Glade Run, and Fickey Run pre- (1996 to 2014) and post-treatment (2018 to 2022) (Carlson 2013; Watson & Merovich 2014; WVDEP 2023). WVSCI scores at all sites increased post-treatment, with two sites exhibiting a significant increase (Fig. 6). An increase in the WVSCI score correlates to an improvement in stream health. The WVDEP generally requires a WVSCI score greater than or equal to 72 for aquatic life uses (Warm Water Fisheries or Trout Waters) in wadable streams (WVDEP 2022). Muddy Creek Mouth saw a significant change ($p=0.0062$) with an average WVSCI score increase of 32.19 points from pre- to post-treatment. The site's average post-treatment score was 63.97, with one reading above the attainment threshold at 83.22. Glade Run Mouth also saw a significant change ($p=0.0143$) with an average WVSCI score increase from 17.25 to 42.38 post-treatment. Fickey Run Mouth did not see a significant WVSCI score change ($p=0.1416$), from an average of 12.87 pre-treatment to 19.52 post-treatment. Similarly, Martin Creek Mouth did not experience a significant WVSCI score change ($p=0.0588$); however, it had an average

WVSCI score increase of 18.82 points from 22.83 pre- to 41.65 post-treatment. Correlating to the increase in WVSCI scores, all sites also displayed an increase in the total number of taxa present, and all but Martin Creek displayed increases in the %EPT (Table 2).

Eleven fish community surveys were completed by WVDEP among the Muddy Creek sample stations. Four surveys were completed at Station 0.0, three surveys at Station 2.1, one survey at Station 3.3, and three surveys at Station 4.4 (Table 3). A comparable pre-treatment survey was not taken at Station 2.1, and a post-treatment survey was not taken at Station 3.3 due to low visibility within the water column. The mouth of Muddy Creek increased from zero fish pre-treatment to over 130 fish during each post-treatment survey across a combined fifteen different species. While there was no pre-treatment survey conducted at Station 2.1, post-treatment surveys show the presence of a combined six species. Notably, sensitive species such as mottled sculpin and trout were found in the downstream stations of Muddy Creek during post-treatment surveys. Zero fish were found at Station 3.3, located just upstream of the confluence of Martin Creek, during the 2015 survey. Station 4.4 provides reference conditions of the cold-water fishery in Muddy Creek upstream of the junction with Martin Creek.

Economic Comparison of Approaches

As built, the Muddy Creek system had larger up-front capital costs compared to the point-source approach but will have superior economics in the long-run due to lower operating costs. The capital costs of the WSR system exceed the estimated avoided costs of building new units to treat all the OSR sites at source by about \$5.7 million (\$2023). Conversely, the annual treatment costs would average approximately \$830,000 less than a point-source approach. Many of the point-source locations are very remote and difficult to access, resulting in more expensive maintenance.

The watershed system capital costs were \$25.4 million (\$2023). These included the following:

- The primary water treatment plant (T&T) built in 2017 and the Glade Run doser used to treat a severely degraded feeder stream, with a combined cost of \$14.9 million in \$2017 (\$23.3 million in \$2023);
- A contribution of \$2.5 million by Southwestern Energy in 2017/2018 for capital expenses (\$3.1 million in \$2023);
- A sludge pump line to move sludge generated at the T&T plant - \$2 million for a planned expenditure in 2024; and
- A new doser on Martin Creek built in 2022 to pre-treat one of the more severely degraded feeder streams - \$79,000 (\$2023).

The Muddy Creek project has been able to leverage funds from Southwestern Energy (SWE), a natural gas producer in an adjacent county, adding to the benefits of the system. These contributions have been in the form of both capital and operating funds directed via the firm's ECH2O (Energy Conserving Water) program to support a commitment to water use neutrality hydro fracturing operations. This means that for each gallon of freshwater SWE uses for well stimulation, the firm will replenish or offset an equivalent amount through conservation and innovation (WVDEP 2016b).

In the first two years of the project, SWE contributed \$2.5 million to the pipeline system that transports AMD water from AML sites on Fickey Run. The firm continues to contribute \$375,000 to \$300,000 per year to offset operating expenses. If these contributions continue at \$300,000 through the 10th year of operations, SWE will have contributed \$5.6 million into the system (\$6.5 million in \$2023), and a total of \$9.1 million could have been saved over a NPDES configuration. With the SWE funds, O&M costs to OSR are reduced to \$280,000/year, saving \$1.1 million per year over the NPDES approach (Table 4). Even with higher capital costs, it is estimated that the watershed approach will begin saving money in its seventh year of operations, which corresponds with 2024 (Fig. 7). When including funds contributed by SWE, the system likely began saving in 2020, its third year of operations.

Table 4 Cost Comparisons – Point Source vs. Watershed Approach (in \$2023)

	Capital Costs	\$ O&M / Year	10-Year Costs
Watershed	\$25.4 million	\$580,000	\$31.2 million
NPDES	\$19.7 million	\$1.4 million	\$33.8 million
Watershed - NPDES	+\$5.7 million	-\$830,000	-\$2.6 million
Watershed w/ SWE	\$22.3 million	\$280,000	\$24.7 million
Watershed w/ SWE - NPDES	+\$2.6 million	-\$1.1 million	-\$9.1 million

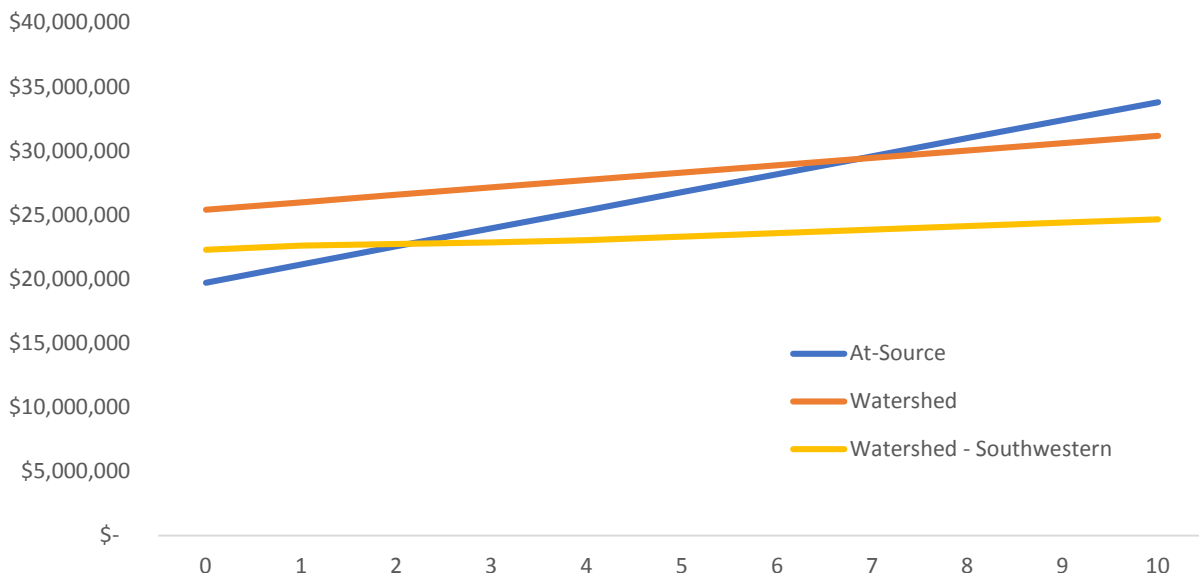

Fig. 7 Cumulative Cost Over 10 Years – Point Source vs. Watershed Approach (\$2023)

Discussion

Muddy Creek has shown significant improvements after watershed-scale treatment began, evidenced by significant water quality and biological recovery. Before treatment, the mouth of Muddy Creek had an average pH of 4.3, an average iron concentration of 8.22 mg/L, and an average aluminum concentration of 8.10 mg/L. Since the implementation of WSR, Muddy Creek has maintained an average pH of 7.2 and concentrations of 1.02 mg/L of iron and 1.37 mg/L of aluminum, correlating to mean reductions of 83% for aluminum concentrations and 88% for iron concentrations. Benthic macroinvertebrate data suggest that the mouth of Muddy Creek has reached the attainment threshold, nearly doubling its WVSCI score since treatment began. This correlates with visual improvements in iron sedimentation, which had previously destroyed habitat available for benthics. Fish survey results show promising reestablishment of the lower portion of Muddy Creek as a cold-water fishery. Where zero fish were previously documented, fish counts are now routinely above 130 individuals across a combined fifteen different species. Another notable improvement is the discovery of sensitive species such as mottled sculpin, smallmouth bass, and trout below the confluence of Martin Creek. These species are sensitive to toxic metals and pH produced from AMD (Allert et al. 2009). Sculpin have shown mortality, infertility, and avoidance in response to environmental contaminants associated with coal mining (Carline et al. 1994; Martin et al. 2020). Additionally, due to the lack of a swim bladder, mottled sculpin inhabits benthic habitats and are rather sedentary with adults tending to maintain residency within small (i.e., <0.5 m²) patches for long periods (Petty 1998). Sculpin therefore are highly susceptible to local change and often serve as an indicator species.

It is difficult to assess the fish response between the mouth of Muddy Creek and the control station at RM 4.4 since there were no pre-treatment surveys completed at Station 2.1. Results post-treatment show lower numbers than both the mouth site and the control site. This may be due to the presence of the short waterfalls located approximately 0.5 miles downstream of Station 2.1, which may slow fish migration upstream. The increase in connectivity resulting from the restoration of lower Muddy Creek will provide opportunities for fish recruitment from upper Muddy Creek as well as the Cheat River. Historically, the quality cold water fishery in upper Muddy Creek was cut off from the Cheat River below the confluence of Martin Creek. Fish communities in isolated headwaters have lower Indices of Biotic Integrity than comparable non-isolated communities, reduced species numbers, and lower numbers of individuals, despite suitable habitat (Stoertz et al. 2002). Thus, the downstream treatment of AMD will create aquatic corridors for fish immigration to improve the fishery in upper Muddy Creek as well.

Upstream of major AMD inputs in the Middle Cheat, such as Pringle Run, the Cheat River is a productive fishery. In fact, the five forks of the Cheat (Blackwater River, Shavers Fork, Dry Fork, Glady Fork, and Laurel Fork) are well-known trout fishing destinations. Prior to 2010, the segment of the Cheat River from RM 51.0 to Cheat Lake was listed as impaired for pH and metals and was considered biologically dead. Due to the treatment of acid mine drainage within several key tributaries, the Cheat River is no longer listed as impaired by pH. Regular measurements from the 1970s to 2022 demonstrate decreasing iron and aluminum concentrations and increasing alkalinity (USEPA 2022). As a result of these improvements, there has been a resurgence in fish diversity. The entire length of the Cheat River now supports fish populations, including pollution-sensitive walleye and a healthy perch population. Fish survey reports from Cheat Lake during the 1950s documented a total of 14 species, predominately within the Catostomidae (suckers) and Ictaluridae (catfish) families (Core et al. 1959). Presently, Cheat Lake supports over 46 fish species, including large and smallmouth bass, walleye, northern pike, yellow perch, channel catfish, and sunfish. Channel catfish of quality length are abundant and fast-growing in Cheat Lake (Hilling et al. 2016). Each summer, the lake hosts several bass fishing tournaments. Despite anecdotal improvements, it is difficult to fully assess the impact of Muddy Creek's treatment on the Cheat River. Pringle Run and several other AMD-polluted tributaries enter the Cheat approximately 8.8 miles upstream of Muddy Creek. In addition, there are little to no published biological surveys within the segment of the Cheat River from Pringle Run to Cheat Lake. It is significant that pre-project, Muddy Creek contributed roughly 50% of the total acid load to the Cheat River. Muddy Creek is now net alkaline.

Improvements have also been documented in the Martin Creek subwatershed as a result of centralized treatment. Specifically, the subwatershed benefits from the direct capture and conveyance of AMD from flooded mine pools to the plant and in-stream dosers in Martin Creek and Glade Run. Before treatment, the mouth of Martin Creek had an average pH of 3.2 and mean iron and aluminum concentrations each above 20 mg/L. After treatment, it has improved to an average pH of 5.1 with 70% and 90% reductions in aluminum and iron, respectively. The Fickey Run and Glade Run tributaries also displayed significant pH improvements. Additionally, Fickey Run experienced a notable 93% reduction in iron and 61% reduction in aluminum. Given the improved chemical environment, benthic macroinvertebrate assemblages also improved in all three streams, with Glade Run displaying significant improvements.

Despite significant improvements, the Martin Creek subwatershed has not yet fully recovered. The Martin Creek doser was installed in 2022, therefore its impacts are not captured in this study. Macroinvertebrate reestablishment after AMD treatment can take more than eight years due to multiple factors, including drought events, delayed or setback recovery, competitive exclusion, and lack of watershed vegetation (Gunn et al. 2009). Additionally, "sacrifice zones" occur downstream of dosers where iron and aluminum hydroxides precipitate. The length of the sacrifice zone in AMD remediated streams is dependent on the stream velocity, gradient, and alkalinity, all of which influence its ability to carry away metal sediments (Kruse et al. 2013). Within the sacrifice zone, finer sediments may negatively affect the biological recovery of the stream. McClurg et al. (2007) found a 1.2 - 1.8 mile zone of ecological impairment downstream from limestone sand treatment in acid deposition-impacted watersheds of WV. Sacrificial zones associated with AMD treatment can be much longer due to higher metal concentrations (Merovich & Petty 2007). In one Ohio stream impacted by AMD, Johnson et al. (2014) found that precipitated metals were elevated for 1.8-3.1 miles immediately downstream of the doser. The doser on Martin Creek is located approximately 1.2 miles from its mouth, thus biological recovery may be limited in this tributary due to the sacrifice zone of metal precipitation.

The combination of lime dosers and the T&T treatment facility was expected to restore the lower 3.4 miles of Muddy Creek below the confluence of Martin Creek to its designated use, thus effectively reestablishing biologic connectivity throughout the entire 15.6 miles of Muddy Creek. This analysis shows evidence that Muddy Creek is reaching this goal just five years into treatment. Routine data collected at the mouth of Muddy Creek shows that it is no longer a significant contributor of AMD-related impairments to the Cheat and is net alkaline with low metal concentrations. It has also shown WVSCI scores above the attainment threshold and a dramatic increase in fish abundance and diversity. The current variance is in effect until

July 1, 2025, though the State may adopt a subsequent water quality standards variance consistent with § 131.14 of the Water Quality Standards Regulatory Revisions Final Rule. Martin Creek has met the interim criteria at the in-stream compliance point since its implementation. However, Muddy Creek mainstem is still occasionally outside of the parameters for healthy water quality standards related to iron and aluminum. While the T&T facility is a major component of watershed treatment, additional treatment measures are needed to address additional abandoned mine land sources. Approximately 0.7 miles above Martin Creek, Muddy Creek receives AMD from several AML sources originating from the Dream Mountain Ranch. In 2024, Friends of the Cheat completed enhancements to a passive treatment system that treats these sources. The completion of enhancements to this system will contribute to the connectivity of the upper and lower portions of Muddy Creek.

Prior to the variance, OSR had been treating sources of AMD at forfeited mine sites since as early as 1995 and was responsible for ten NPDES outlets within the Muddy Creek watershed. This included construction, operations, and maintenance at nine active sites with fifteen lime dosers, and one passive system at six bond forfeiture sites, not including three other sites planned for future construction. Costs to build and operate the existing sites totalled approximately \$3.4 million for construction and nearly \$10 million for operations and maintenance (roughly \$940,000 annually) prior to the approval of the variance in 2017 (Cooper 2017).

Without an alternative permitting structure, OSR would have been required to retrofit seven existing treatment systems and construct two new sites within the Martin Creek subwatershed, all without restoration of Muddy Creek. The watershed approach allowed the OSR to save money by avoiding both capital costs associated with building new point-source treatment systems to NPDES standards and operational costs by not having to treat water at point-source for all permits in the watershed, and by not having to assume new point source operations. Many point-source locations are very remote and difficult to access, resulting in more expensive maintenance. Thus, approaching treatment from a watershed-scale rather than a point-source scale may produce superior economics in similar watersheds. Furthermore, the treatment is completed more quickly with more stream miles recovered. Additionally, centralized treatment has the potential for recovering rare earth elements (REEs) and critical materials (CMs) from the AMD treatment byproducts (Larochelle et al. 2021). This would be less practical in small passive or doser systems. Projected revenues from REE/CMs will likely offset operations and maintenance costs at the facility, based on economic studies conducted at different AMD treatment locations.

This study was limited by the availability of pre-treatment data, especially biological data, flow data to calculate pollutant loadings, and data on the receiving Cheat River. Collecting data from the Cheat River downstream of Muddy Creek is extremely difficult due to access limitations and whitewater, so available fish data was collected a considerable length downstream in Cheat Lake. Future watershed-scale treatment projects should include biological considerations, such as stream connectivity and sacrifice zones, in the early planning stages. Additionally, a plan for fish and benthic surveys should be implemented before treatment in order to assess its effect on biological recovery.

Conclusions

Watershed-scale treatment reduces the number of treatment locations while restoring the maximum number of stream miles. For less cost than the conventional point-source approach, the watershed approach treats most the acidity in the stream rather than the small fraction that originates at regulated sites. Muddy Creek provides a case study for the effectiveness of this approach. After five years of treatment, evidence shows that it has significantly improved the water quality and biological richness in Muddy Creek, thus reconnecting upper Muddy Creek with the Cheat River system. Once the largest contributor of AMD pollution into the Cheat, Muddy Creek is now net alkaline.

Consensus Coal Production Forecast for West Virginia: 2023

Introduction

The West Virginia Consensus Coal Production Forecast is a combined production forecast comprised of four component forecasts. A consensus approach to forecasting seeks the wisdom of the crowd in producing an expectation for output from the coal industry. The Consensus Forecast is used to provide the best expectation of tax revenues to be collected for mandatory reclamation activities conducted through the Special Reclamation Fund and the Special Reclamation Water Trust Fund.

This report describes recent historical coal production trends for the State of West Virginia including the individual industries that comprise the major segments of demand for coal produced in West Virginia. Each of the component forecasts used to form the Consensus Forecast is described, with information about assumptions and resulting projected levels of production for West Virginia. The process used to produce the Consensus is also described, including the weightings applied to each of the component forecasts. The West Virginia Consensus Coal Production Forecast is calculated for the years 2023 through 2045.

Overview of West Virginia Coal Production

West Virginia coal production for 2022 was 83.5 million tons (EIA, 2023),¹ an increase from the 78.6 million tons produced in 2021. West Virginia's 2022 production is the highest figure since the start of the COVID-19 pandemic, though it is still below pre-pandemic levels. This increase reflects various trends and events within the coal industry's primary markets: power generation, exports, and industrial demand, as well as the return to normalcy from the COVID-19 pandemic. The demand for West Virginia coal increased 6.2% from 2021 levels, primarily from an increase in exports.

Future demand for West Virginia coal depends on several variables. These include the pace of economic recovery from the pandemic, the capacity of gas-fired electrical generators in the region and the price paid for gas by those generators, the lifespan and generation levels of the coal-fired power plants that will continue to burn coal from the State, the extent of new renewable generation, exchange rates, the rate of economic growth of countries that import

¹ 83.5 million tons is the Energy Information Administration's revised 2022 production value based on the final 2022 value published by MSHA (clean coal production reported on MSHA Form 7000-2). The West Virginia Office of Miner's Health, Safety and Training (WVOMHST) reports 2022 production of 96 million tons, but this may not be exclusively clean coal, which is the final production volume.

West Virginia coal, and the nature of compliance with environmental regulations. Recent demand trends with preliminary and estimated data for 2022 are shown in Figure 1.

Figure 1. Historical West Virginia Coal Production and Components of Demand

Source: EIA. Asterisk (*) 2022 volumes estimated by MU CBER. Other 2022 figures are preliminary by EIA.

The Electricity Sector

Preliminary coal distribution data for 2022, published by the U.S. Energy Information Administration (EIA), indicate that demand for West Virginia-produced coal by the electricity sector slightly increased in 2022, to about 39.5 million tons, compared to 37.6 million tons in 2021 (EIA 2023). This was an increase of 5.2 percent, while total US coal distribution to the electric power industry marginally increased by 2.0 percent during the same time (EIA 2023). In addition, WV distribution of coal to the electricity sector as a proportion of total US distribution has increased; in 2019 WV distributed about 7.5% of coal to the electricity sector, in 2022 that figure was 8.7%.

Natural Gas Prices

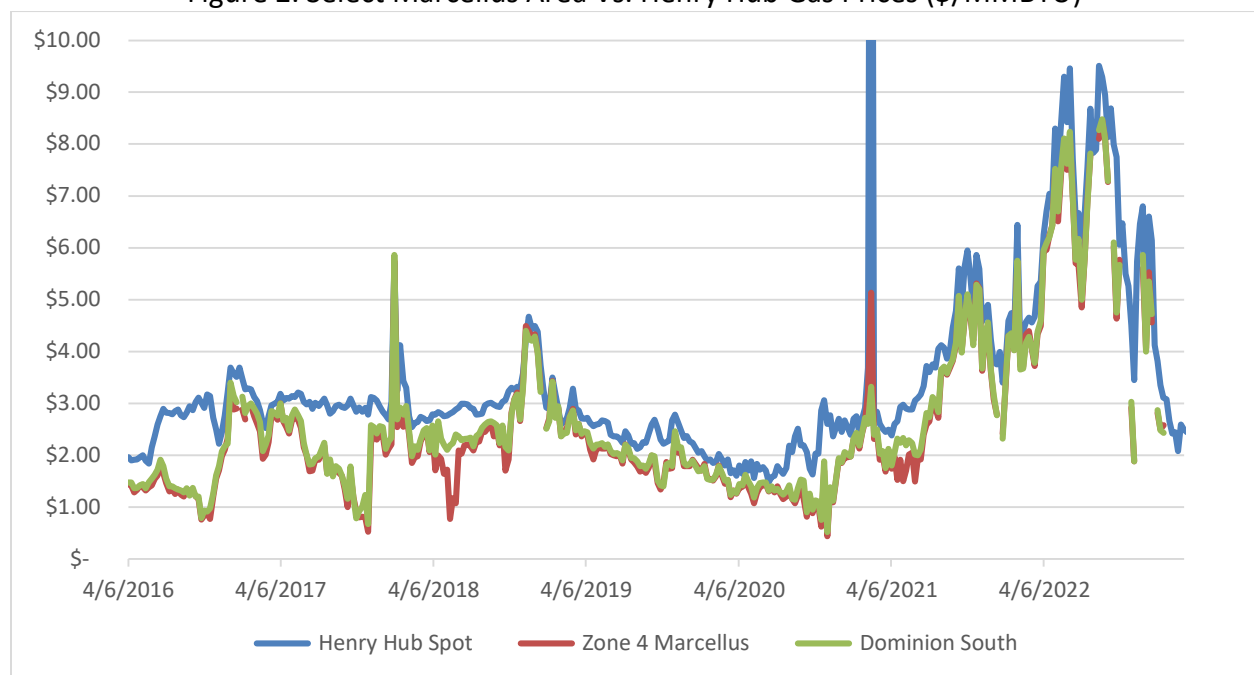

Historically, the price of natural gas has a direct relationship with the demand for coal; as natural gas prices rise, coal demand increases. From 2021 to 2022, the average price of gas delivered to the electric power sector increased sharply, averaging \$5.17/mcf in 2021 (nominal dollars) and \$7.52/mcf in 2022 (EIA 2022), a 45% increase. The past two years of natural gas

prices were significantly more expensive than recent historical prices, which averaged \$3.17/mcf from 2017 to 2020. The rise can be attributed to the Russian invasion of Ukraine and its external affects, and demand increases, due in part to the economic recovery from the COVID-19 pandemic.

The 2021 to 2022 rise in natural gas prices correlated with increases in demand for West Virginia coal by power plants, with year-over-year increases in both years. Since January 2023, natural gas prices have returned to what are historically more normal levels.

For several years, abundant gas production from the Marcellus play, combined with relatively low takeaway capacity, resulted in especially low gas prices in a primary region in which West Virginia coal competes. The price differential of the Henry Hub Spot price to the Marcellus play has diminished but persists at times, as shown in the following chart of weekly prices at the two primary Marcellus area price hubs vs. the Henry Hub (Figure 2).

Figure 2. Select Marcellus Area Vs. Henry Hub Gas Prices (\$/MMBTU)

Source: EIA, Natural Gas Weekly.

In its Annual Energy Outlook (AEO) 2023 Reference Case analysis, the EIA projects natural gas prices to sharply decline in the short-term. Much of this is due to assumptions about future policy changes impacting supply of Russian gas that would lower prices. Long-term, the EIA projects natural gas prices to climb and maintain between \$3.50 to \$4.00. Regarding coal, the EIA projects price of steam coal to slightly decrease but consistently maintain around \$2.00/MMbtu with little to no volatility (Figure 3) (EIA 2023).

Figure 3. EIA Forecasted Natural Gas & Coal Prices to Electricity Sector

Source: EIA, AEO 2023.

Coal-Fired Power Plant Retirements

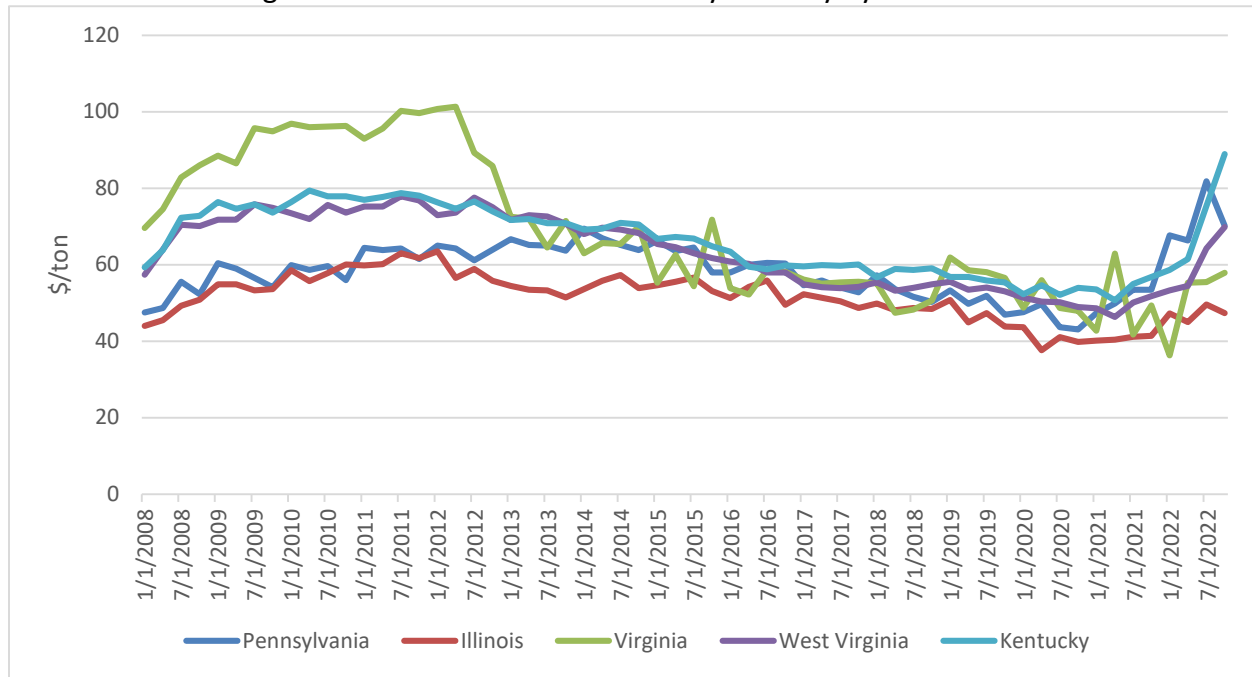

In recent years, many coal-fired power plants have retired, with several of those plants being consumers of West Virginian coal. In 2022, two major plants retired that were consumers of West Virginia coal, the William H. Zimmer plant (OH) - capacity of 1,305-megawatts (MW) - and the Morgantown Generating Station (MD) - capacity of 1,205 MW. In 2022, EIA released a report stating that coal will account for 85% of U.S. electric generating capacity retirements in 2022, with coal retiring 12.6 gigawatts of capacity.

Prices of Coal Delivered to the Electricity Industry

The price of West Virginia-produced coal delivered to power plants has largely been falling since around 2012. However, prices have increased since quarter 2 of 2021, and in quarter 4 of 2022 West Virginia experienced a spike close to the previous decade's high.

Average coal prices for regional producing states are much closer than in previous decades. Prior to 2013 West Virginia, Virginia, and Kentucky producers commanded a premium over coal produced from Pennsylvania and Illinois. By 2017 that premium had largely disappeared. However, the gap has come back for Illinois coal as that aggregate price has not increased at same levels as other states (Figure 4).

Figure 4. Coal Prices to the Electricity Industry by Mine State

Source: EIA, Quarterly Coal Report.

Environmental Regulation

The U.S. Environmental Protection Agency (EPA) has updated the Coal Combustion Residuals (CCR) rule. The rule requires power plants to monitor and inspect coal ash storage sites and to act if any leaks or other problems are detected. In November 2020, the EPA published the Part B Final Rule, which allows “facilities to demonstrate to EPA that, based on groundwater data and the design of a particular surface impoundment, the operation of the unit has and will continue to ensure there is no reasonable probability of adverse effects to human health and the environment. EPA approval would allow the unit to continue to operate.” The EPA is now proposing a process for facilities to seek additional time, if needed to address demonstrated grid reliability issues (Environmental Protection Agency, 2023).

The EPA is also proposing authority under the Clean Water Act (CWA) to reduce discharges of toxic metals and other pollutants from power plants into waterbodies. The proposed rule, Steam Electric Power Generating Effluent Guidelines (2023) would establish more stringent discharge standards for wastewaters generated at coal fired power plants. The EPA estimates the proposed regulation would reduce pollutants discharged through wastewater from coal-fired power plants by approximately 584 million pounds per year (EPA 2023).

The Inflation Reduction Act of 2022 offers funding, programs, and incentives to accelerate the transition to cleaner energy sources. This will also likely drive more deployment of clean

electricity resources - namely wind and solar power plants - which means there will be more competition for coal. Most provisions became effective on January 1, 2023 (EPA 2023).

The case Sackett vs EPA was ruled in May 2023. It concerns how the EPA determines its regulatory jurisdiction under the CWA. The decision sided with Sackett, with the majority arguing the CWA extends only to “wetlands with a continuous surface connection to bodies of water that are ‘waters of the States’ in their own right.” Justice Kavanaugh- joined by three other justices- argued that the court is “rewriting of adjacent to mean adjoining.” Kavanaugh expressed concern that regulatory power from the CWA will decline and “produce consequences for the waters of the United States and will generate regulatory uncertainty.”

The Industrial Sector

As shown In Figure 1, demand for West Virginia coal by the industrial sector (coke plants and self-generating manufacturers, including coal-fired combined heat and power plants) have fluctuated around 11 million short tons since 2016. Coke plants have increased from the 2016 volume of 8.3 million short tons to 11 million short tons and 10.1 million short tons in 2021 and 2022, respectively. On the contrary, the industrial sector has decreased from a volume of 1.7 million short tons in 2016 to 0.7 million short tons in 2022.

In 2021, the U.S. imported 28.6 million metric tons (mmt) of steel, a 42.8% increase from 20 mmt in 2020. The U.S. steel trade deficit amounted to 21 mmt, a 50% increase from 13.9 mmt in 2020. Imports from Russia (280%) showed the largest volume increase in 2022, followed by Vietnam (198%), Turkey (81%), Taiwan (54%) and Mexico (44%) (ITA, 2023).

Exports

The nation’s coal exports have risen since 2020, increasing from 69 million short tons in 2020 to 84.8 million short tons in 2022, but remains significantly less than in previous decades.

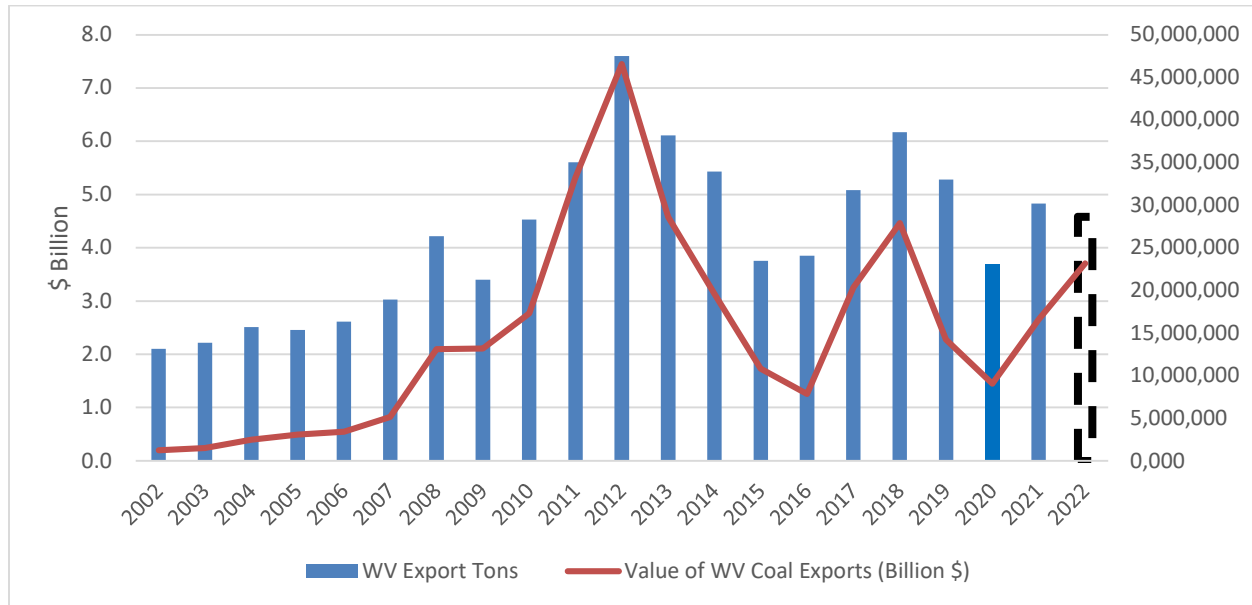

Likewise, West Virginia’s coal export volumes have increased, from 23.1 million short tons in 2020 to 28.7 million short tons in 2022. Contrary to the U.S. as a whole, West Virginia’s export volume remains relatively strong compared to historical levels back to 2002.²

The value of coal exports from West Virginia increased from \$2.7 billion in 2021 to \$3.7 billion in 2022, the second highest figure since 2014. The state maintained high-level exports to many countries in North America, Europe, South America, Africa, and Asia. The top five importing countries by value were India, the Netherlands, Brazil, Japan, and the United Kingdom (ITA,

² 2022 data for coal export tonnage by U.S. state of origin has not yet been released. CBER estimates West Virginia’s exports based on historical shares of total exports and the value of coal exports from the state.

2023). Figure 5 shows the value of West Virginia-based coal exports and associated tonnage from 2002 to 2022.

Figure 5. Value and Tonnage of West Virginia Coal Exports, 2002-2022

Component Forecasts

Energy Information Administration (EIA)

Publication: Annual Energy Outlook 2023
Date: March 2023
Forecast Horizon: 2022-2050
Region(s): Northern Appalachia, Central Appalachia

The EIA provides a forecast of coal production by region in its 2023 Annual Energy Outlook, projecting through 2050 via its National Energy Modeling System (NEMS). NEMS uses a market-based approach that balances energy supply and demand while considering regulations and industry standards. NEMS is a modular system, with modules that represent each of the fuel supply markets, conversion sectors, and end-use consumption sectors of the energy system (EIA, 2023).

Only the EIA Reference Case figures are used for the Consensus forecast, which represents EIA's 'best assessment of how U.S. and world energy markets will operate through 2050.' This projection assumes improvement in known energy production, delivery, and consumption technology trends (Energy Information Administration, 2023).

The EIA's forecasts for Appalachia are used to create an EIA forecast for West Virginia coal production. The method used is described in Appendix B.

Key Assumptions:

Macroeconomic Issues: Real GDP growth averages 1.9% per year from 2022 to 2050.

Coal Prices: EIA projects the average mine mouth price for all coals to be about \$38/ton in 2022 (2022\$) and to rise to \$65 by 2050.

Natural Gas Prices: Henry Hub³ spot prices are expected to be about \$6.52 in 2022, sharply decline to a bottom of \$2.80, then slowly rise resulting in an expected price of \$3.77/MMBtu in 2050. The long-term annual growth would be -1.90%.

Electricity: U.S. use of coal for production of electricity is expected to decline by 4.1% annually through 2050. Coal-fired generating capacity is expected to decrease at a rate of 3.7 percent

³ The Henry Hub in Louisiana is the delivery point for the natural gas futures contract on the New York Mercantile Exchange.

per year through 2050. By comparison, combined cycle (natural gas) capacity is projected to increase by 0.6% per year and renewable capacity to increase by 4.9 percent per year.

Industrial/Commercial: Industrial self-generators (CHP plants, power plants with a non-regulatory status, and small on-site generating systems) are expected to see a decrease in coal consumption of 1.4 percent per year through 2050. Coal use in coke plants is projected to decrease by 0.5 percent per year. The commercial sector is expected to maintain flat coal consumption of one million tons per year.

Exports: U.S. coal exports are projected to rise from 85 million tons in 2022 to 130 million tons in 2025, and to continue rising to 161 million tons in 2035 and 217 million tons in 2045.

Environmental: The AEO2023 includes the effects of current legislation, environmental regulations, and international protocols including recent government actions for which implementing regulations were available as of the end of November 2022. This includes the new Federal laws and regulations such as the Inflation Reduction Act (IRA)- which provides tax credits for clean energy and more- that passed in August 2022. In addition, Illinois, North Carolina, Nebraska, and Rhode Island enacted new legislation for their clean energy standards (CES) programs. Lastly, the AEO2023 includes CES executive branch targets for Colorado, Connecticut, Louisiana, Massachusetts, Michigan, New Jersey, and Wisconsin (EIA, 2023).

Energy Ventures Analysis (EVA)

Publication: EVA Long-Term Forecast

Date: April 2023

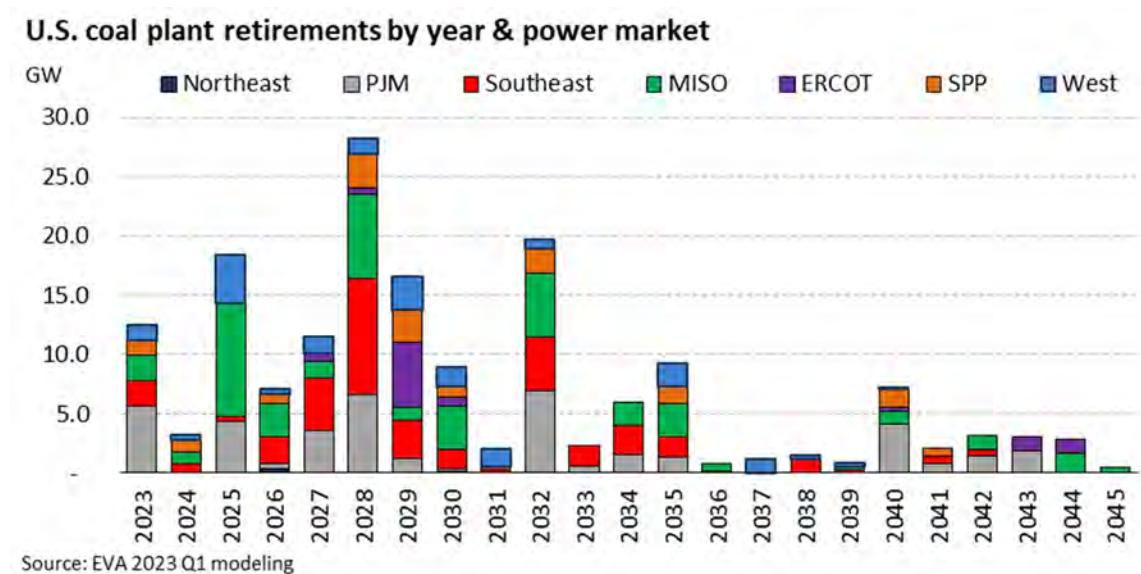

Forecast Horizon: 2023-2050

Region(s): All states

EVA utilizes the AURORAxmp 24/7 dispatch model (which EVA licenses) to calculate electricity generation by fuel type. The forecast reflects the least cost dispatch solution consistent with the operating parameters of individual units and regulatory requirements. Existing generation, planned generation deemed to be likely to be constructed, and announced retirements are reflected. In addition, the model adds and retires capacity in an economic manner and as required by law.

Key Assumptions:

Coal Plant Retirements: Due to renewed environmental pressure from the current administration, e.g., the Good Neighbor Rule, NAAQS for fine particulates, Coal Combustion Residuals, and Effluent Limitations guidelines, coal retirements will likely continue at an accelerated rate through the 2020s and early 2030s. They will congregate around EPA compliance deadlines for the various rules.

Coal Prices: Coal prices vary by region, coal quality, and market and were relatively high in 2022 due to the strength in the global market and economic growth due to recovery from COVID.

Going forward real prices are expected to increase and soften modestly throughout the forecast period. Future pricing also reflects the higher cost of capital related to the reduced access to capital due to environmental, social, and governance (ESG) concerns.

Natural Gas Prices: Like coal, Henry Hub gas prices jumped in 2022, softening since then. The very mild winter of 2022/2023 reduced gas demand, resulting in lower gas prices and coal displacement in the power sector. Nominal natural gas prices are expected to increase in the long-term but will vary due to sensitivity to weather conditions.

Electricity: Growth in electricity demand is expected to average 1.0% per year. This rate of growth is higher than in prior years due to the expected impact of electric vehicles on demand. Utility demand for coal is expected to decline from about 460 million tons in 2022 to less than 100 million tons by 2050. The decline is heavier in the early years as plants are retired.

Industrial/Commercial: Demand from other sectors is also expected to decline, reflecting industrial plant conversions from coal to natural gas and reduced metallurgical coal in steelmaking as the industry continues to shift from blast furnace to electric arc furnace production. All coal supply regions are affected as industrial plants are retired. However, all domestic metallurgical coal is expected to originate in Appalachia.

Exports: U.S. export levels are a function of the competitiveness of U.S. coals which in turn is affected by the relative strength of the U.S. dollar particularly with respect to the Australian dollar as global coal trade is U.S. dollar denominated and Australia is the largest exporter of bituminous coals. The U.S. exports both steam and metallurgical coals, but U.S. metallurgical coal exports exclusively originate in Appalachia. While global metallurgical coal demand is expected to decline, some continued blast furnace production is expected through 2050.

Steam coal exports are largely expected from Northern Appalachia, the Illinois Basin, the Powder River Basin, and the Rockies. Central Appalachia is believed to be not economic long-term and therefore unlikely to participate except in unusual circumstances. While the U.S. continues to be a swing supplier, contraction in the global coal industries has given it a larger role. The war in Ukraine increased U.S. exports to Europe as Russian coal was diverted to Asia, and the loss of natural gas from the Nord Stream pipelines increased demand for coal.

Environmental: Coal Combustion Residuals (CCR) and Effluent Limitation Guidelines (ELGs) are assumed to go into effect according to their regulatory schedules. Plants which are not expected to comply are assumed to be retired. Federal carbon limitations are not assumed. Compliance is assumed with announced state/regional plans. Pennsylvania is no longer assumed to join the Regional Greenhouse Gas Initiative (RGGI). The caps in AB32 (California) are assumed to be extended through 2050. The Inflation Reduction Act is implemented.

Marshall University Center for Business and Economic Research (CBER)

Publication: CBER West Virginia Coal Production Forecast 2023

Date: April 2023

Forecast Horizon: 2023-2045

Region(s): West Virginia

MU CBER's forecast was conducted by Dr. Avishek Mallick of the Marshall University Mathematics Department. The forecast is a Vector Autoregression (VAR) model with seasonality adjustment using quarterly data from 2008-2022.

Key Assumptions:

This VAR model is a demand-based model. It forecasts coal production using several price and demand related variables (Table 1). All variables (both impulse and response) were considered endogenous and modeled as first order Autoregressive Process (AR1).

The CBER forecast does not impose any macro- or micro-economic assumptions that may be subject to exogenous shocks in the future.

Table 1. Variable Description and Data Source

Variable	Source
WV Total Coal Production	EIA
Total WV Coal Delivered to the Electricity Industry	EIA
Delivered WV Coal Prices for Power Generation	EIA
Delivered US Natural Gas Prices for Power Generation	EIA
Euro/Dollar Exchange Rate	Macrotrends

West Virginia University Bureau for Business and Economic Research (BBER)

Publication: WVU BBER Coal Production Forecast 2023

Date: May 2023

Forecast Horizon: 2023-2050

Region: Northern West Virginia and Southern West Virginia

The WVU Bureau of Business and Economic Research Coal Production Forecast is an econometric model based upon changes in factors that affect the demand and price for coal sourced from mines in Northern and Southern West Virginia between 1985 and 2022. Historical data on coal prices, production and other energy-related data are obtained from a variety of Energy Information Administration reports. Forecasts for US-level explanatory variables were taken from the S&P Global Intelligence (formerly HIS) March 2023 Long-Term Forecast and the 2023 Annual Energy Outlook from the Energy Information Administration (West Virginia University, 2023).

Consensus Forecast

The four long-term forecasts produced by EIA, EVA, CBER, and BBER are combined to create the 2023 Consensus Forecast for West Virginia Coal Production. For simplicity, a simple average was used to calculate the consensus forecast⁴ (Figure 6 and Table 2). Coal production in West Virginia is projected to decline from 83.5 million tons in 2022 to 79.7 million tons in 2023, followed by a steady decline to about 59.6 million tons in 2045.

Summary

The four component models incorporate a range of possible levels of West Virginia coal production over the next 22 years, with varying forecasts that illustrate the impact of primary supply and demand variables and uncertainty over the continuation of recent trends. The consensus reduces uncertainty by combining the forecasts into one aggregate projection. The consensus forecast predicts West Virginia will experience a gradual decline in coal production throughout the period, but at levels that are four to seven million tons per year higher than the 2021 Consensus Forecast.

⁴ Due to the subjective nature of weight selection, a simple average approach (with same weight for all four forecasts) would generate a very similar forecast as the weighted average but does not require additional (often unrealistic) assumptions to estimate accuracy rate of historical forecasts.

Appendix A: EIA Forecasts for Regional Coal Production

EIA forecasts Appalachian coal production to decline gradually through 2032, with greater stability from 2032 to 2050. As shown below (Figure A1), Interior⁵ production is projected to have moderately less production compared to Appalachian production throughout the period. Northern Appalachian⁶ (Figure A2) production is expected to rapidly decrease, reducing the difference between Northern Appalachia and Central Appalachia. It is expected for Northern to decrease production from 91 million short tons to 53 million short tons by 2033 and fluctuate at similar levels through 2050. On the contrary, Central Appalachia is projected to gradually decrease production to 42 million short tons in 2033 and then 30 million short tons in 2050. There is a projected 20-million-ton difference between the two Appalachian regions for most years.

Figure A1. EIA Forecasted Coal Production by Region

⁵ Arkansas, Illinois, Indiana, Iowa, Kansas, W. Kentucky, Louisiana, Mississippi, Missouri, Oklahoma, and Texas.

⁶ Northern Appalachia includes Pennsylvania, Maryland, Ohio, and N. West Virginia. Central Appalachia includes Virginia, E. Kentucky, N. Tennessee, and S. West Virginia.

Mr. Matthew Butler
Deputy Director
Division of Land Restoration
West Virginia Department of Environmental Protection
Office of Special Reclamation
47 School Street Suite 301
Phillipi, WV 26416
Matthew.L.Butler@wv.gov

Dear Mr. Butler,

Enclosed is the actuarial review of the West Virginia Department of Environmental Protection (“WVDEP”) Special Reclamation Fund and Water Trust Fund (“SRF” and “WTF”, respectively, or collectively “the Funds”) as of June 30, 2023.

The first section in the text of our report is the *Executive Summary*. This section presents our conclusions and recommendations. It also describes the purpose and scope of our report, explains the distribution and use of our report, and provides the conditions and limitations underlying our work. This section of our report also includes the Background section which provides information about the Fund history.

The next section of the text of our report is the *Actuarial Analysis* that describes the sources of data, our overall methodology, the selection of factors and specific methodologies and considerations by line of business. It also describes the selection of ultimate losses. The *Exhibits* section of our report follows the text of the report and includes all of our analyses.

Please feel free to call if you have any questions regarding any aspect of our report.

Sincerely,

Daniel W. Lupton, FCAS, MAAA, CSPA, MBA

Evelyn Toni Mulder, FCAS, MAAA, FCA

Bobby J. Jaegers, ACAS, MAAA, CSPA, FCA

Executive Summary

Purpose and Scope

Taylor & Mulder, Incorporated (“T&M”) was requested by the West Virginia Department of Environmental Protection (“WVDEP”) to conduct an actuarial review of its loss reserves as of June 30, 2023. This report contains our summary and conclusions along with a description of the analysis underlying our conclusions.

Specifically, T&M was asked by the WVDEP to conduct an actuarial analysis to include within its scope the following tasks:

- A valuation in accordance with applicable actuarial standards of practice promulgated by the Actuarial Standards Board of the American Academy of Actuaries that will determine the Program’s fiscal soundness;
- An evaluation of the present assets and liabilities of the Special Reclamation Program for a minimum of 20 years, including an annual table illustrating those assets and liabilities for underground versus surface mine permits, small versus large permits (based on bond amounts or acreage) and permits for tipples, preparation plants, and impoundments and illustrating land and water liabilities separately;
- An evaluation of the prospective assets and liabilities of the Special Reclamation Program for a minimum of 20 years, including a table illustrating estimates of underground versus surface mine permits, small versus large permits (based on bond amounts or acreage) and permits for tipples, preparation plants, and impoundments and illustrating land and water liabilities separately, including the funded status of the Water Trust Fund (“WTF”) as well as the Special Reclamation Fund (“SRF”);
- A table that combines the findings of the two previous tasks;
- An analysis and discussion of the ability of the Program to support long term and/or perpetual liabilities; and,
- A one-page executive summary of conclusions with references to the body of the report.

Note: This is a “closed” valuation of the Funds’ liabilities insofar as it considers only liabilities arising from permits that have already been issued. The estimated liabilities account for current

known reclamation projects as well as anticipated permit revocations on permits issued prior to June 30, 2023. Anticipated income is also linked to permits issued by June 30, 2023 without regard to future permits issued.

This report presents the results of those analyses. This report was prepared by:

- Daniel W. Lupton, FCAS, MAAA, CSPA, MBA, Vice President and Consulting Actuary,
- Evelyn Toni Mulder, FCAS, MAAA, FCA, Principal and Consulting Actuary,
- Bobby J. Jaegers, ACAS, MAAA, FCA, CSPA, Vice President and Consulting Actuary

In accordance with the requirements of the Actuarial Standards of Practice in making statements of actuarial opinion, I provide the following statement:

I, Daniel W. Lupton, am Vice President and Consulting Actuary in the firm of Taylor & Mulder, Inc. I am a Fellow of the Casualty Actuarial Society in good standing and qualified to issue a Statement of Actuarial Opinion. I am also a Member of the American Academy of Actuaries.

Conclusions

Overall Fund Liabilities

The following chart shows the projected undiscounted liabilities for land reclamation costs, water capital costs, maintenance and operations costs, and administrative expenses for the next 20 years:

West Virginia Office of Special Reclamation Actuarial Reserve Study as of June 30, 2023 Special Reclamation Fund and Water Trust Fund Combined Undiscounted Liabilities			
Expense Category	Current Forfeitures	Prospective Forfeitures	Total Liability
Land Reclamation Costs	28,294,342	91,970,150	120,264,492
Water Capital Costs	44,313,589	88,016,419	132,330,008
O&M Costs*	122,414,879	23,988,658	146,403,536
Administrative Expense			63,308,707
Total Liability	195,022,809	203,975,226	462,306,742

*O&M Costs are Operation and Maintenance Costs

It should be noted that because this is a “closed” study, the above table does not include anticipated liabilities arising from permits issued after June 30, 2023.

Administrative expenses in the above table include employee benefits, contractual obligations, personnel services, and unclassified expenses other than reclamation costs. The following table shows the estimated total liability from all forfeitures (current and projected) for the next 20 years, as well as a comparison to the same values projected as of the previous study:

West Virginia Office of Special Reclamation Actuarial Reserve Study as of June 30, 2023 Special Reclamation Fund and Water Trust Fund Combined Undiscounted Liabilities			
Expense Category	Current Study	Prior Study	Difference
Land Reclamation	120,264,492	99,746,231	20,518,261
Water Capital	132,330,008	225,077,369	(92,747,361)
Water O&M	146,403,536	180,831,780	(34,428,244)
Administrative*	63,308,707	59,166,576	4,142,131
Total	462,306,742	564,821,955	(102,515,213)

Relative to the prior study, the current study anticipates higher land reclamation and administrative expenses. Water capital liabilities declined significantly due to decreases in outstanding costs for currently contracted work. For example, on an uninflated basis, the current scheduled water capital

liabilities total \$42.8 million, down from \$116.3 million. The projected future water capital liabilities through 2043 have increased from \$67.2 million to \$68.9 million. Changes in land reclamation and water O&M liabilities were likewise driven primarily by changes in current scheduled expenditures.

A detailed breakdown of these liability cash flows is provided in Exhibits E-6 through E-9.

Funds' Assets

In addition to projecting the Funds' liabilities, we also projected the Funds' assets. This was performed in the context of modeling future fiscal year cash flows. The following chart shows anticipated revenues over the next 20 years:

West Virginia Office of Special Reclamation Actuarial Reserve Study as of June 30, 2023 Projected Revenues for SRF and WTF	
Revenue Category	20 Years
Bond Forfeitures	42,614,042
Civil Penalties	9,220,872
SRF Coal Fees	115,749,766
WTF Coal Fees	134,592,752
SRF Investment Yield	3,140,328
WTF Investment Yield	155,062,799
Total	460,380,558

Note that due to the closed nature of the study, the revenues in the table above only reflect projected revenues associated with currently in-force permits. The actual anticipated revenues over that time period are considerably higher. For example, the SRF and WTF coal fees included in the table above represent only 66% of the total anticipated coal production over the next 20 years, as coal production in future years will increasingly come from permits that have not yet been issued as of June 30, 2023.

Relatedly, it should be noted that the actual investment yield will vary based on the rate at which funds must be transferred from the WTF to the SRF to pay for liabilities. Because the WTF earns a higher investment yield than the SRF (projected 4.9% as compared to 1.5%), additional revenues in the SRF (for example, from coal tonnage fees associated with new permits that are outside the scope of our study) will have a significant positive impact on total investment yield over time. This

is because less money will need to be transferred from the WTF to the SRF to pay for reclamation activities, and therefore more investment income can be earned.

Technical details regarding how each revenue category was projected are provided in **Appendix A**, below. Revenue projection details are provided in Exhibits E-3 through E-5.

Financial Projections

Our projections of revenues and expenses to the Funds imply that the Funds will be solvent on a cash basis through 2043. The chart on the following page shows a simplified cash flow projection for the SRF and WTF combined over the next 20 years.

West Virginia Department of Environmental Protection Office of Special Reclamation
Actuarial Reserve Study as of June 30, 2023
Financial Projection

Fiscal Year Ending 6/30	Total	Total	Beginning Balance		WTF to SRF	Ending Balance	
	<u>Expenditures</u>	<u>Revenues</u>	<u>SRF</u>	<u>WTF</u>	<u>Transfers</u>	<u>SRF</u>	<u>WTF</u>
Prior						12,934,042	154,739,346

2036	20,687,990	20,314,433	10,000,000	162,690,720	13,692,724	10,000,000	162,317,162
2037	20,069,436	19,727,209	10,000,000	162,317,162	13,395,658	10,000,000	161,974,935
2038	19,761,325	19,277,469	10,000,000	161,974,935	13,341,582	10,000,000	161,491,079
2039	19,336,085	18,623,470	10,000,000	161,491,079	13,263,532	10,000,000	160,778,464
2040	18,951,808	18,175,839	10,000,000	160,778,464	13,119,669	10,000,000	160,002,494
2041	18,853,246	17,571,998	10,000,000	160,002,494	13,332,207	10,000,000	158,721,246
2042	18,490,579	17,105,464	10,000,000	158,721,246	13,200,570	10,000,000	157,336,131
2043	18,232,826	16,643,900	10,000,000	157,336,131	13,165,970	10,000,000	155,747,204

Note that these projections assume that the Water Trust Fund transfers money to the Special Reclamation Fund in order to maintain a fund balance of \$10,000,000.

A detailed version of this financial projection is provided in Exhibit E-2, which shows the breakdown by type of undiscounted expenditure and revenue item.

Recommendations

Coal Production Risks: There has been some instability in coal production forecasts and the coal market in general over the preceding decade as a result of different regulatory regimes, alternative energy adoption rates, economic events, and, most recently, the COVID-19 pandemic. Future studies may benefit from considering alternative coal production scenarios.

Permit Status History: Permit databases were evaluated as of a specific date. However, because this study estimates anticipated changes in permit status over time, it is necessary to make assumptions about how permit statuses change in order to develop forfeiture models. If records exist, it could be possible to produce more accurate models if a full history of each permit (including all status changes over time and dates when status changes occurred) were available.

Background

On August 3, 1977, Congress enacted the Surface Mining Control and Reclamation Act of 1977 (“the SMCRA”) to encourage the reclamation of mined areas and return land and water resources to beneficial use. The SMCRA established a program for the regulation of mining permits and a program for reclaiming bond forfeiture sites. In West Virginia, reclamation of abandoned mine lands is performed by the West Virginia Department of Environmental Protection (“WVDEP”) Office of Special Reclamation.

Funding for the reclamation of mined areas comes from bond forfeitures, coal tonnage fees, civil penalties, and interest income. The largest of these funding sources is coal tonnage fees. Coal tonnage fees of \$0.15 per ton of coal mined are deposited in the Water Trust Fund (“WTF”) and \$0.129 per ton are deposited in the Special Reclamation Fund (“SRF”). Amounts from bond forfeitures go to the SRF.

Currently, all reclamation activities, including water treatment, are paid through the SRF, with amounts being transferred to the SRF from the WTF to fund payment of certain costs. Financial projections assume that funds will be transferred to the SRF to maintain a certain minimum balance of working capital, and that the remaining amounts will be left in the WTF to achieve a higher average investment yield.

Report Distribution and Use

This report has been prepared for internal use by the management of the WVDEP and its board, its accountants, auditors, and attorneys, and the West Virginia legislature. The WVDEP is not authorized to include this report in any marketing or request for proposal solicitations. In addition, it should be understood that T&M consultants are available to respond to any questions by authorized third parties with respect to this report.

Conditions and Limitations

The analyses contained in this report were performed using accepted loss and loss adjustment expense reserving methods adjusted to the special needs of the WVDEP and in conformance with sound actuarial standards and principles. T&M introduced assumptions and judgments that we considered appropriate in the circumstances.

With regard to projections of ultimate values, it should be understood that the emergence and settlement of claims are subject to uncertainty. While we have used our best professional judgment in all instances, projections of future ultimate losses and loss expenses are inherently uncertain because of the random nature of claims occurrences. They are also dependent upon future contingent events and are affected by many additional factors.

WVDEP claim reserving procedures, current and perceived social and economic inflation, current and future court and jury attitudes, legislative changes affecting the WVDEP, improvements in technology, and many other economic, legal, political, legislative and social factors all can have significant effects on ultimate claim costs. Therefore, we cannot warrant that actual developments

will not differ from current projections. Such differences could be upward or downward and could be significant.

In summary, the ultimate loss and loss adjustment expense levels estimated in this report are subject to potential variations in estimation due to:

- (1) the fact that the ultimate liability of WVDEP is subject to the outcome of events yet to occur;
- (2) the unanticipated changes in the legal, economic, legislative or claims adjudication environments;
- (3) statistical fluctuation in losses around the estimated or expected values when all other factors remain constant; and
- (4) the fact that the actual future loss and loss payment and reporting patterns may differ from those applied in the determination of the expected losses or there may be unanticipated changes in the loss and expense loss and expense payment and reporting patterns;

Accordingly, no assurance can be given that future loss emergence will not deviate from the estimated ultimate loss and loss adjustment expenses. However, the ultimate loss and loss adjustment expense estimates were based on a reasonable application of generally accepted actuarial procedures and techniques applied to the information available.

We reviewed the information for overall reasonableness and consistency.

T&M relied without audit or verification on historical loss, loss adjustment expense, exposure data, and other information provided by the WVDEP and its employees. T&M has relied upon the data provided and on the oral and/or written statements made regarding the quality, accuracy, and completeness of the data and information supplied. Any inaccuracies or inconsistencies in the data could have a significant effect on the conclusions drawn.

Should any inaccuracies be found in the data, T&M should be notified immediately so that the analysis can be adjusted accordingly.

With regard to projections of estimated revenues, it should be understood that the revenue streams are subject to uncertainty similar to that experienced in modeling loss projections. While we have used our best professional judgment in all instances, projections of future revenues are inherently uncertain due to potential changes in technology, the implementation of environmental requirements, the introduction of and/or enhanced use of alternative fuels, and changes in the economy among others. While T&M has used its best judgment in selecting values and trends for each category of revenue, actual revenue collected is dependent upon unknown future events and may be affected by additional factors outside of WVDEP control.

This report is limited in scope to the estimate of the level of reserve adequacy at the evaluation date of the report. It also includes projections regarding cash flow of the operations of the WVDEP under certain narrow assumptions and conditions.

This report was prepared for use by persons technically competent in insurance financial matters. Persons receiving this report should be made aware of the availability of T&M personnel to answer questions and/or amplify on any matter addressed therein.

Appendix A: Actuarial Analysis

Sources of Data

The data underlying our analysis was compiled from several sources. The following are the primary sources from which data was taken and how each data source was used:

- **Special Reclamation Database:** This database was provided by David B. McCoy, Engineer-Chief, Division of Land Reclamation. The database includes information pertaining to historical and ongoing reclamation projects in the state, including site characteristics, land use information, anticipated and actual land and water reclamation costs (both individual capital expenditures and ongoing costs), and administrative costs.
- **Permits database:** This database was provided by Amy Crouser, Assistant Director for the WVDEP Division of Mining and Reclamation. This database includes data on permits issued between 1961 and June 30, 2023, including the permit status, permit location and type, bond amount, and bonded acres.
- **2023 Consensus Coal Forecast** by the Center for Business and Economic Research at Marshall University was used for coal market history and projections.
- **Special Reclamation Fund Expenditures:** This database was provided by Scott Fairchild, Financial Reporting Specialist (II) for the WVDEP. This database included SRF and WTF expenditures from July 1, 2005 to June 30, 2023.
- **Revenues for WTF and SRF** were also provided by Scott Fairchild. These databases include all revenues to the Special Reclamation Fund and Water Trust Fund from July 1, 2005 to June 30, 2023.
- **Prior Actuarial Reports:** These were provided by Mr. Sheehan to provide additional context for our projections.
- **Coal Production Decline Rates,** including an analysis of anticipated coal production decline rates, was provided by John Morgan, indicating the anticipated rate at which coal production will decline from currently in-force permits.
- **SRF and WTF Investment Allocations:** These were provided by Mr. Sheehan and were used to project anticipated SRF and WTF investment revenues based on the allocation of funds to money market, short term bonds, and IMB fund.

Overall Methodology

Loss Projections

Losses were projected using two models: a traditional deterministic model and a stochastic generalized linear model, described in greater detail below.

Based on the results of these methods, we selected anticipated payment amounts in each future fiscal year. A three-year delay was added to these payment patterns to account for the delay between a permit revocation and the commencement of reclamation activities at the site.

Current cost estimates on active reclamation activities were adjusted for historical variances between cost estimates and the final costs. These costs were then spread out over time, assuming 50% of costs will be incurred in the year that work is scheduled to commence and 50% of costs will be incurred in the following year for land reclamation and water capital costs. Water operations & maintenance costs were projected to continue each year according to current estimated annual costs subject to an annual attenuation factor of 98% starting in 2033. This is due to the fact that annual O&M costs associated with currently active reclamations are projected to show modest declines after 10 years.

All costs are then adjusted to nominal dollars using an inflation factor of 2.5%.

Deterministic Loss Model

The traditional deterministic model projects anticipated bond forfeiture and permit release rates based on historical data triangles. Permits are arranged into cohorts by year of permit issuance based on the assumption that permit releases and bond forfeitures vary based on the age of permit. From these data triangles, overall release and forfeiture rates are selected for each age of permit, then adjusted to reflect anticipated differences in rates for permits based on current status (active, inactive, or phased release). These release and forfeiture rates are applied to currently open permits, separately for surface, underground, and other mine types and separately by permit status types. A final adjustment is made based on bond size, whereby

permits backed by smaller bonds (less than \$500,000) are anticipated to be forfeited at a rate that is higher than permits backed by large bonds (greater than \$500,000.)

These adjusted forfeiture and release rates are applied to currently open permits or bonded acres to determine the number of permits and acres expected to be released or forfeited each year in the future. We then apply anticipated average costs per forfeited acre to determine future costs by year for the anticipated land reclamation costs, water capital costs, and water operations & maintenance costs.

Stochastic Loss Model

The stochastic model uses advanced statistical techniques to project future anticipated forfeiture and release rates.

The stochastic model is formally based on a kind of generalized linear model, specifically a multinomial logistic regression model. The model uses historical data about forfeited and released bonds to predict the probability that open permits will experience forfeiture or release each year in the future. In addition, the stochastic model considers the parent companies of each permit and simulates bankruptcies from parent companies. When a parent company experiences bankruptcy, we project that the probability of forfeiture for the company's permits is increased by 30% for the year following. This is based on the understanding that although parent company bankruptcies can lead to forfeitures, the permits are often sold as assets to other companies as a way of preventing further forfeitures.

Technical details of the stochastic model are provided as **Appendix B** of the report.

Comparison of Deterministic and Stochastic Models

The deterministic and stochastic loss models have unique advantages and disadvantages that we considered carefully as part of our projections.

The deterministic model has the advantage that patterns of releases and forfeitures can be easily visualized. As a result, it is possible to make selections of anticipated release and forfeiture rates that explicitly anticipate recent or future changes in rates that could affect loss projections. By comparison, the stochastic model is less intuitive, and it can be challenging to make manual adjustments to fitted model results.

However, there are several drawbacks to the deterministic model that prompted the development of the stochastic model. First, the method assumes that future forfeitures and releases are roughly statistically independent. This assumption may be incorrect. Recent years have seen increasing consolidation in coal industry. As a result, permits are controlled by a smaller set of companies. For this reason, a single bankruptcy could lead to a large number of simultaneous forfeitures. This key issue was accounted for explicitly in the stochastic model.

Relatedly, the deterministic model makes a simplifying assumption about the number of bonds that will be forfeited or released in a year. For example, for a given age, the deterministic model may project that 0.93% of a particular kind of bond will be forfeited. Realistically, this means that a given bond will be forfeited with probability 0.93% or not forfeited with probability 99.07%. However, the deterministic model projects that 0.93% of all bonds will be forfeited. That is, for a given bond of 100 acres, the deterministic model might project that 0.93 acres will be forfeited in that year, where in actuality either 0 acres or 100 acres will be forfeited. This assumption may result in excessive confidence about the accuracy of the central estimate, particularly with respect to the timing and amount of cash flows. The stochastic model, by comparison, simulates individual permit behavior directly and thereby avoids using this assumption.

A final advantage of the stochastic model is that the use of a statistical framework enables the use of model validation tools that are not generally available for traditional models. This makes it possible to directly assess the extent to which different assumptions impact model predictive performance and deliver a model that is optimized to provide the most accurate predictions possible. In the deterministic model, predictions are assumed to be accurate, and model

validation is, at best, implicit in the extent to which forfeiture or release rates are selected to mirror or diverge from historical rates.

Revenue Projections

Anticipated coal tonnage fees were modeled by considering the anticipated change in Appalachian coal production per year from the consensus coal forecast as well as the effect of the “runoff” of permits. The runoff of permits is comprised of two separate factors:

1. A factor representing the reduction in number of active permits among the current cohort of open permits. This factor was projected as part of the loss models.
2. A factor representing the reduced coal production over time among the permits that remain open. This factor was determined judgmentally based on discussions with the Board and based on analysis provided by John Morgan, as discussed above.

With respect to the second point, we assumed the following rates of decline in coal production:

	Northern Mines	Southern Mines
Underground Mines	2.5%	5.0%
Surface Mines	25.0%	10.0%

Bond forfeitures revenues were determined based on the loss models. The deterministic loss model tracked the anticipated bond dollars forfeited in each period. The stochastic loss model considered the bond dollars forfeited across different simulated scenarios. These projections were combined to select a central estimate of bond forfeiture revenues.

Civil penalties were anticipated to decline in a manner commensurate with the decline in production on the current cohort of permits.

Investment returns were projected based on historical average returns. Short term bond fund and money market fund yields were projected by assuming that returns would drift over time from current values in the direction of historical averages. IMB yields were determined based on a review of historical IMB yields, capping returns at 5.0%. Although IMB yields continue to be very strong, this cap at 5.0% represents a departure from previous analyses which capped

yields at 5.5%; this change was taken for the sake of conservatism given the current uncertain interest rate environment.

Administrative Expense Calculations

Historical administrative expenses were provided to us for the years 2006 through June 30, 2023. Administrative expenses are defined as the sum of employee benefits, contractual obligations, personnel services, and other unclassified expenses.

Administrative expenses associated with the current cohort of permits were projected assuming 3% inflation each year and discounted based on the projected number of remaining permits in force from the cohort of open permits as of June 30, 2023.

Appendix B: Technical Details of the Stochastic Loss Model

Data Pre-Processing

The model was fitted on closed permits. However, the permit database only reflects the current status of the permits and the date that this status was set. Therefore, to determine the probability that a permit stays open in a given year, it was necessary to reconstruct historical permit data reflecting the fact that a permit with certain attributes was open in a given year.

For example, if a permit was issued in 1990 and released in 2000, the permit database reflects a single entry of “released” with a status year of 2000. However, inherent in that entry is an implied 10 years in which the permit had “open” status (during 1990, 1991, ... 1999).

Model Form

The stochastic loss model is a multinomial logistic model with four outcomes: “Open,” “Forfeited,” “Release,” and “Terminated.” It predicts, based on a linear predictor, the log-odds of each outcome. The model was fitted using a neural network as part of the “nnet” package in R.

The linear predictor of the model is of the following form:

$$\begin{aligned} & \textit{Permit Type} \times \textit{NS} \times \textit{Permits} \times \textit{Permit Years} \times \textit{Spline}(\textit{Age}^*, 3) \\ & + \textit{Spline}(\textit{Log}(\textit{Cohort Acres}), 3) + \textit{Spline}(\textit{Issue Year}, 5) + \textit{Poly}(\textit{Age}, 2) \end{aligned}$$

Where the variables used are described as follows:

Variable	Description
Permit Type	Notes whether a permit is a surface mine, underground mine, prospect, or other
NS	Notes whether a mine is in a northern or southern county
Permits	Counts the number of permits held by the permittee
Permit Years	Counts the sum of the ages of all permits held by permittee
Cohort Acres	Sum of acres held by all permits issued in the same year as a given permit
Age	The length of time that a permit has been in force
Age*	Age, subject to a maximum value of 3
Issue Year	The year that a permit was issued

Spline(Variable, N)	A “beta spline” function of a given variable with N-1 knots. This is a piecewise function of 3 rd degree polynomials with N different “pieces.”
Poly(Variable, N)	An N-degree polynomial function of the variable

Beta splines were used after initial testing revealed that high-order polynomials produced superior fit (as measured by the AIC and by cross entropy error, discussed below) but failed to provide useful results when extrapolating beyond the training dataset. We determined that this was due to the inherent instability of high-order polynomials. We determined that spline functions produced similarly good fit over the training data and test set but generalized more robustly over the set of open permits.

Compared to the model form employed in the 2021 actuarial reserve study, this model has one adjustment, which is that the spline of permit age was interacted with Permit Type, NS, Permits, and Permit Years, whereas in the previous analysis it was not. This means that in the present analysis, the impact of permit age on the risk of forfeiture depends on the type of permit, whether the permit is in the northern or southern part of the state, and the number and total overall age of permits held by the permittee, whereas in the previous analysis the age of a permit was a separate variable that did not change dependent on these factors.

Variable Selection and Model Validation

The closed permits were split randomly into 80% training data and 20% test data. After the model form was determined, the model was re-fit on the entire dataset. Model predictions were carried out on the set of open permits.

Variables tested included size of bonds, specific county, permit status, specific permit type, and bonded acres. These variables were generally rejected either because of missing data or because they resulted in over-fitting the model. The same is true of many variable interactions that were tested.

Variables were selected based on the extent to which they improved the Akaike Information Criterion (AIC) of the model over the full training data or the extent to which they improved the

cross-entropy error in the test dataset. This is a measure of the degree to which the model properly categorizes permits as being open, forfeited, released, or terminated.

The model was additionally validated using plots of actual and fitted permit forfeitures and by reviewing model statistics such as t-statistics.

Initial tests of the model included the “Status Year” variable, indicating the latest year when the status of the permit was updated. This variable significantly improves the AIC and cross-entropy error when using a random sample of data, but out-of-time samples perform very poorly. This seems to be the result of the historical patterns in permit forfeiture, which causes the Status Year variable to generate significant over-fitting. For this reason, Status Year was excluded as a variable in this study.

Simulation

The final simulation was carried out in two steps. First, the baseline “status probabilities” (i.e., the probability that a permit remains open, is forfeited, etc.) were determined for each open permit for each of the 20 years in the future. Then, for each of 5,000 simulations, we carried out the following procedure:

1. Simulate whether each of the ultimate parent companies goes bankrupt in a given year using a Bernoulli probability distribution with probability 0.5%. This probability is based on default probability for high-grade credit ratings from major credit rating agencies.
2. Augment the baseline status probabilities with the simulated bankruptcies by adding 30% to the unnormalized log-odds of a permit being forfeited. This means that if a permit previously had a 10% probability of being forfeited, following the bankruptcy it would have a $(10\% + 30\%) / 130\% = 30.8\%$ probability of being forfeited. The 30% probability was based on discussion with the Board and judgment.
3. For each year in the future, the status of each permit was simulated until the permit status was no longer “open.”
4. The results of this simulation were stored, and then the process was repeated for the next simulation, starting at step 1.
